

Streaming Linked Data & RSP4J!

Recent Advancements and Future Work

SRW, Amsterdam, Netherlands, Europe,
Earth, Milky Way, Universe 42

A Book

Streaming Data

- Continuous Processing
 - Querying
 - Machine Learning
- Reactive Processing
 - Complex Event Recognition
 - Anomaly Detection

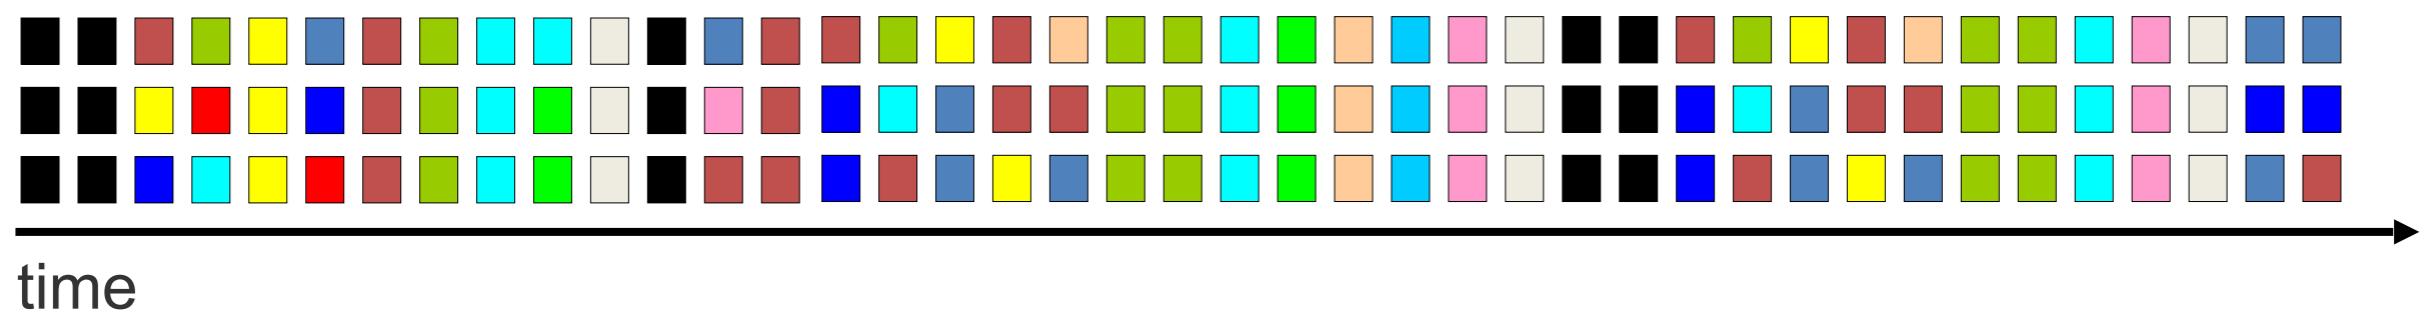

Stream Processing

How many colours in the last minute?

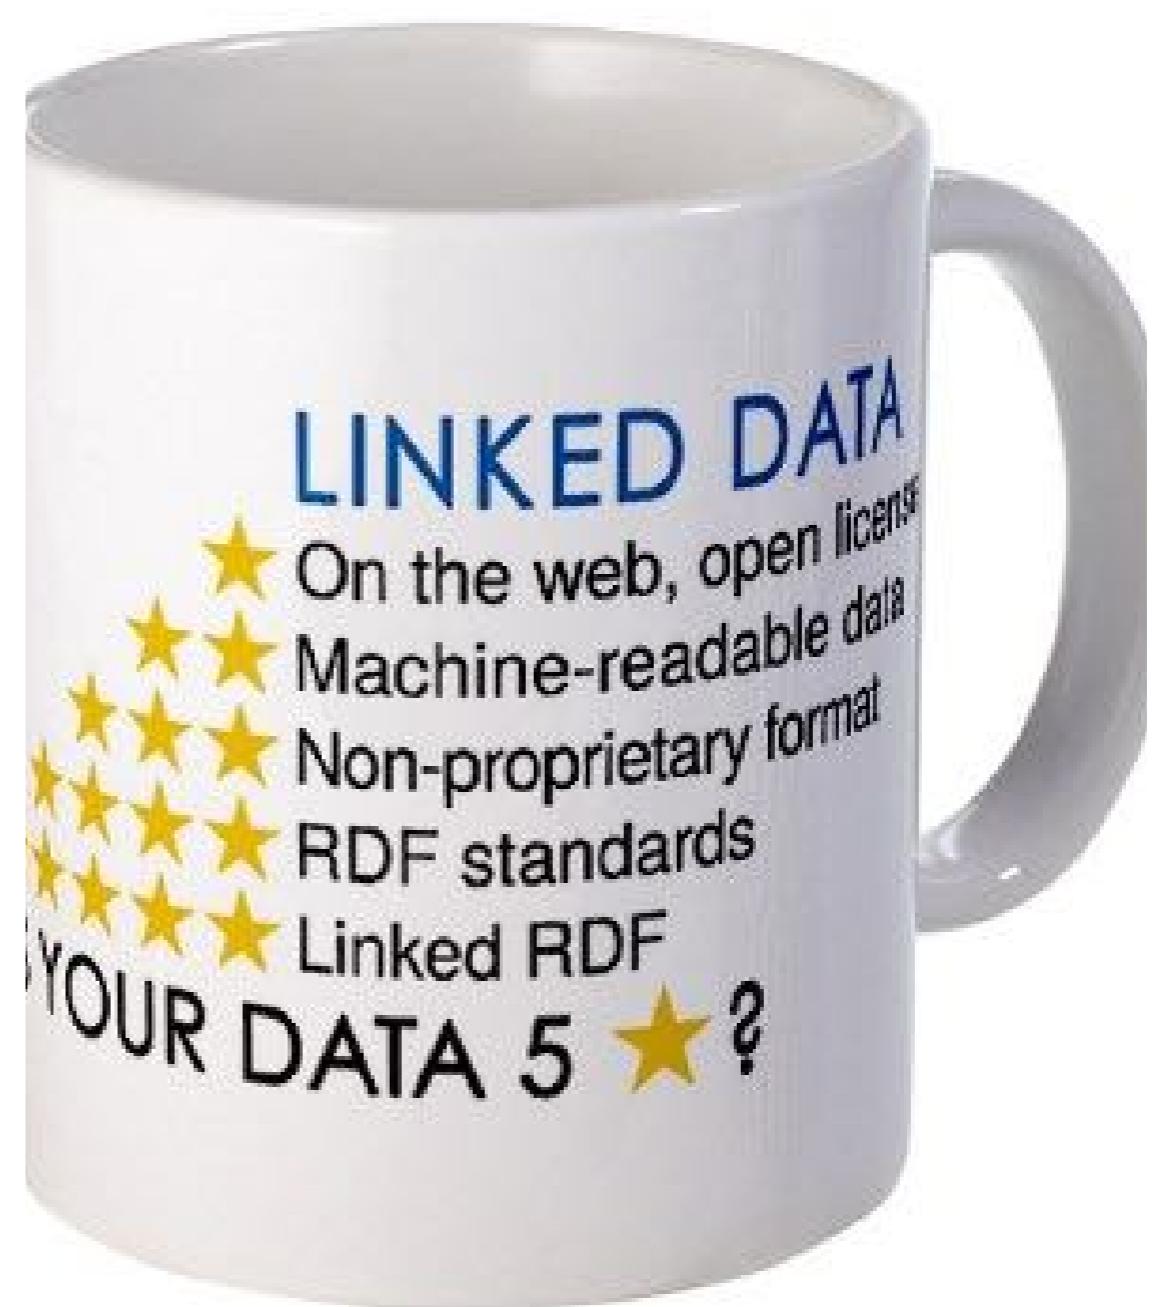

$$(\textcolor{blue}{\blacksquare}, 13), (\textcolor{brown}{\blacksquare}, 8), (\textcolor{orange}{\blacksquare}, 8)$$

1 minute wide window

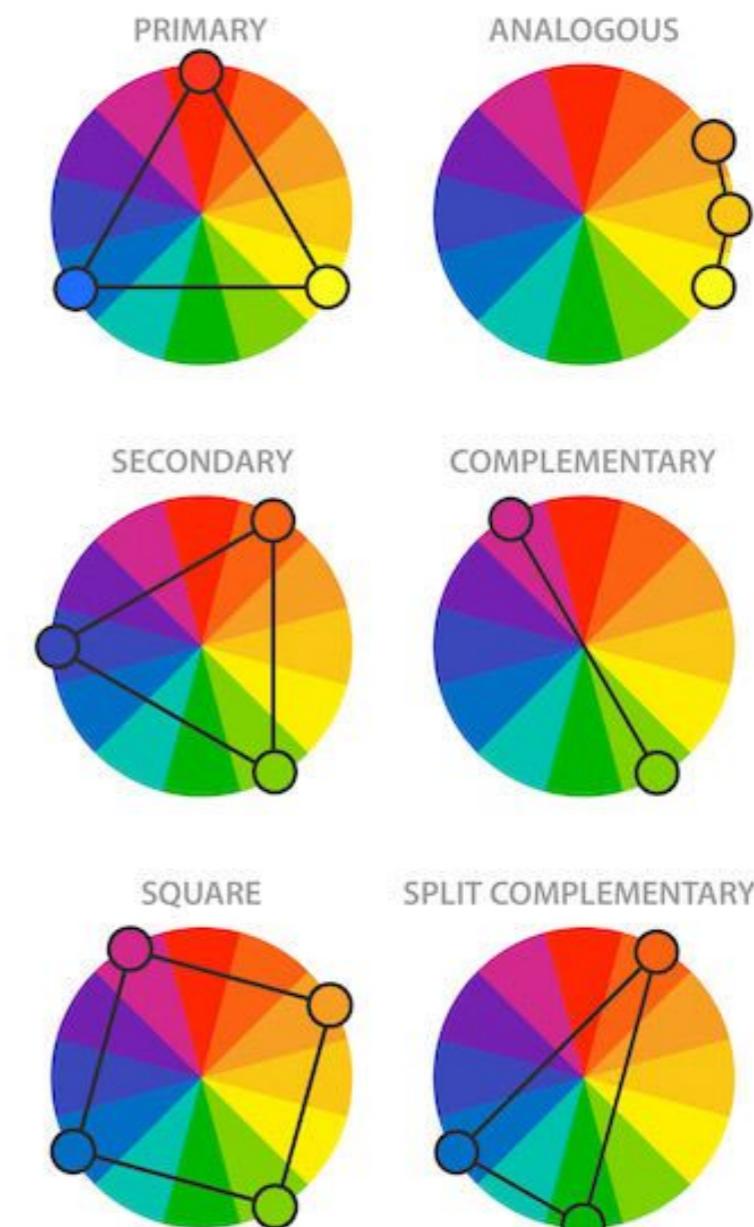

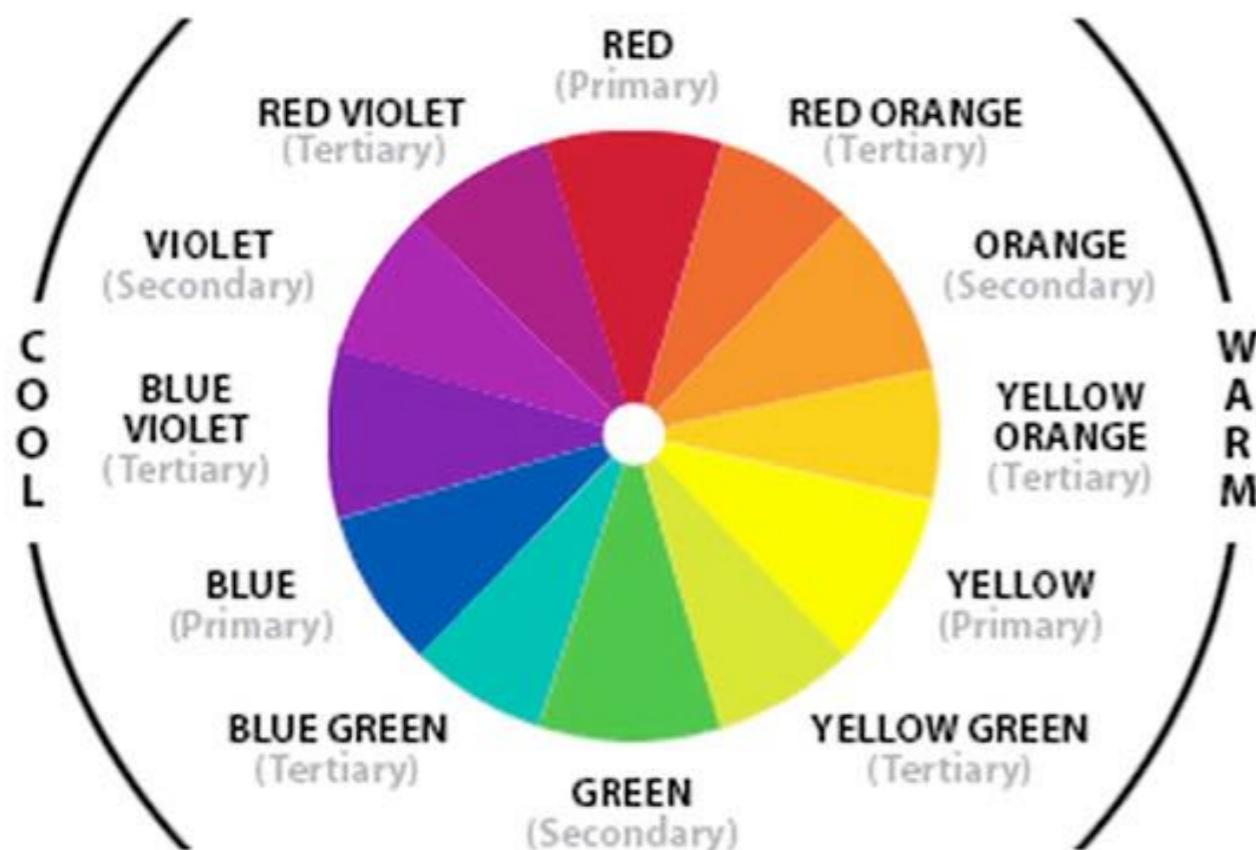

Linked Data

- Linked Data are structured data which is interlinked with other data so it becomes more valuable through semantic queries.

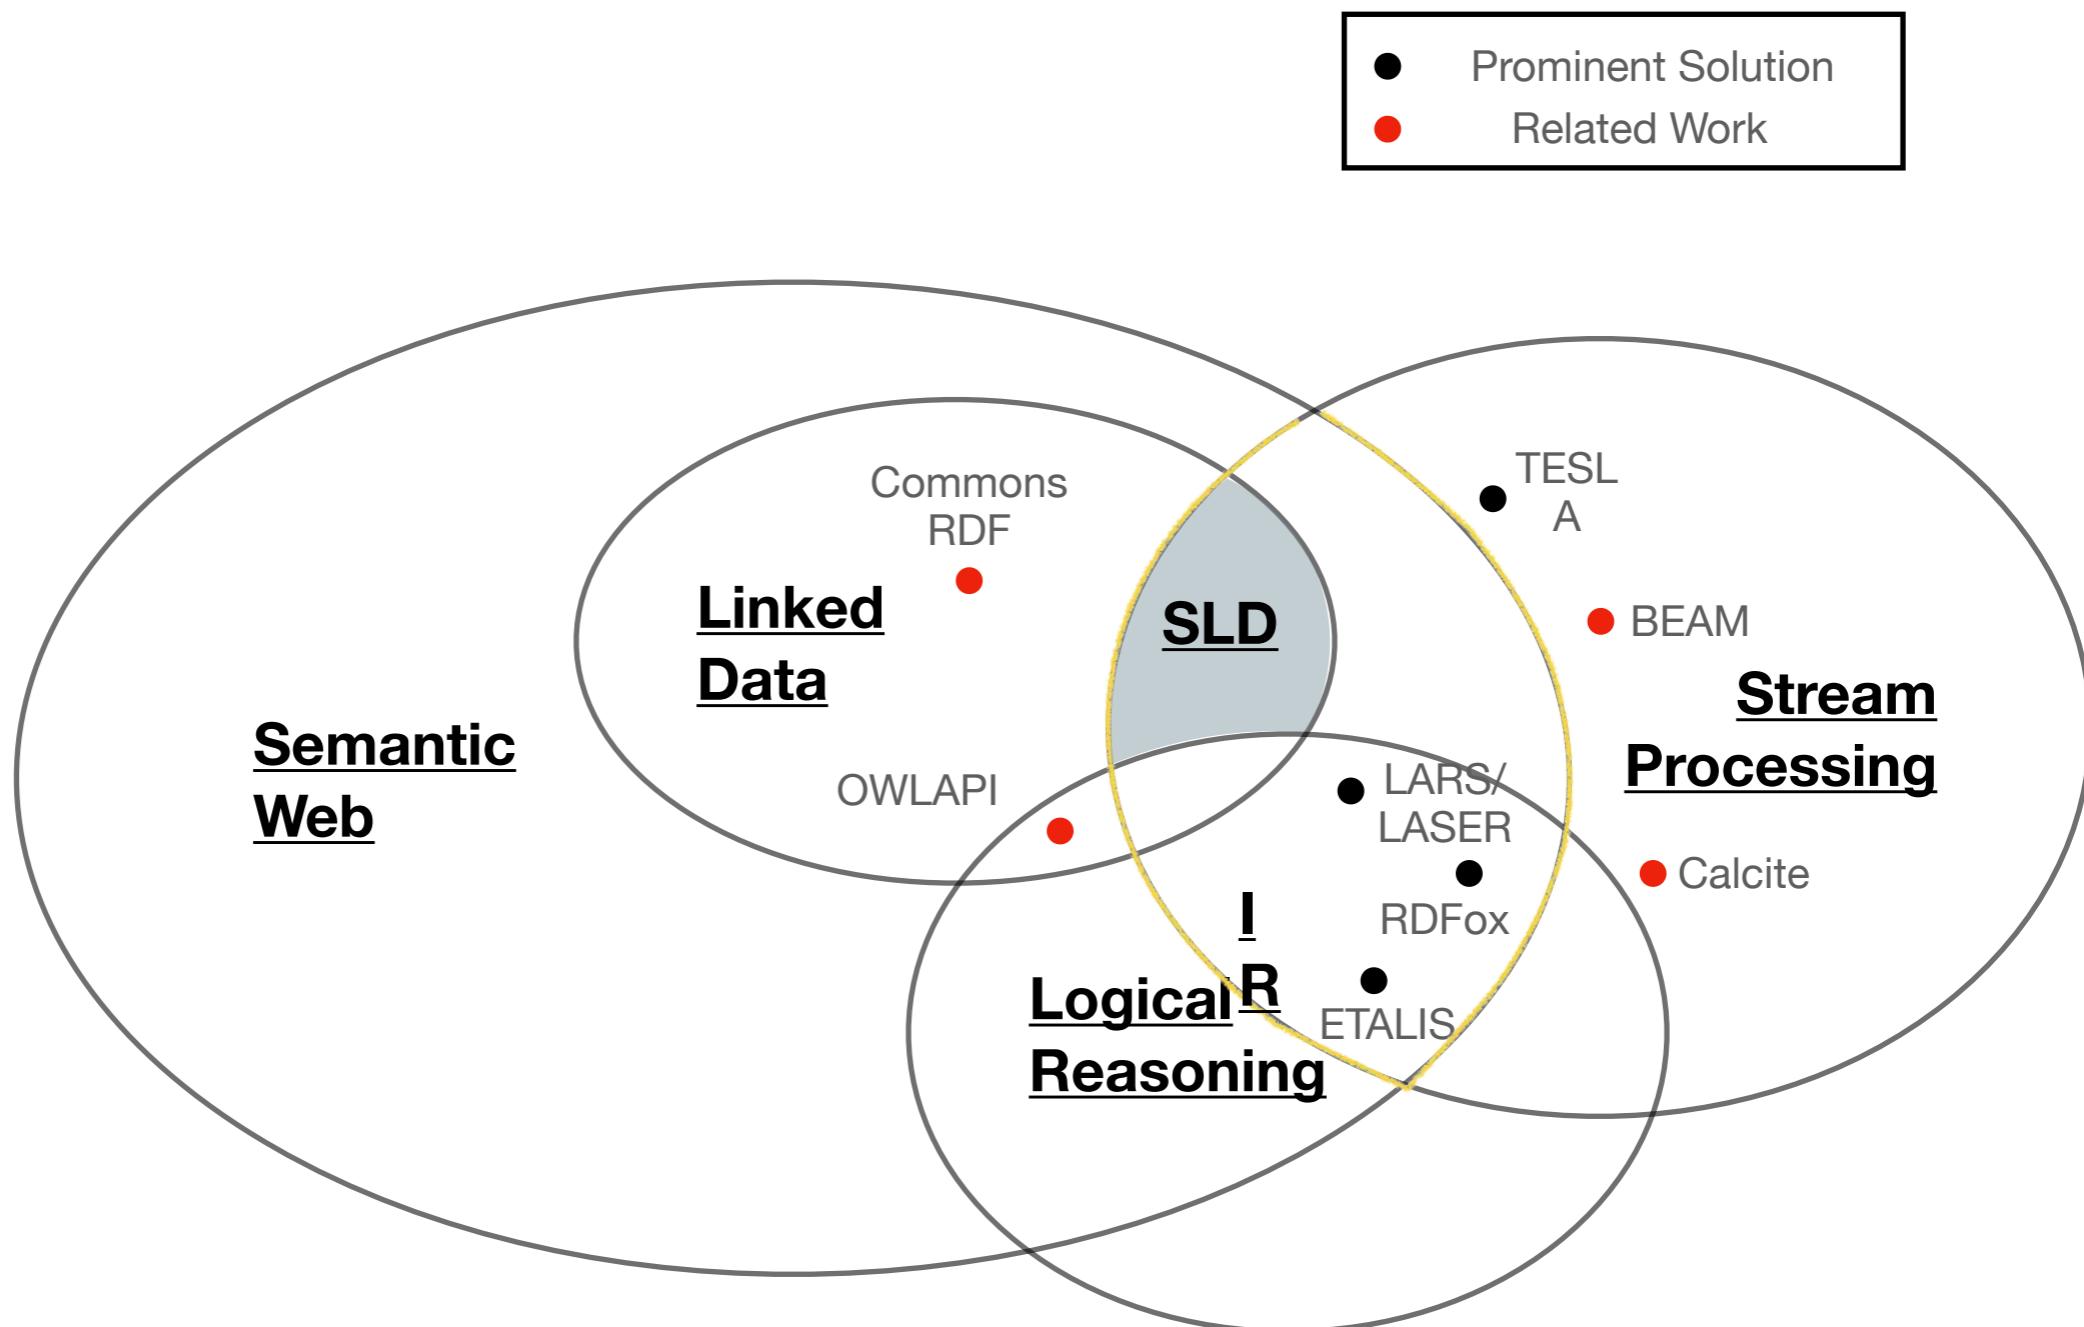

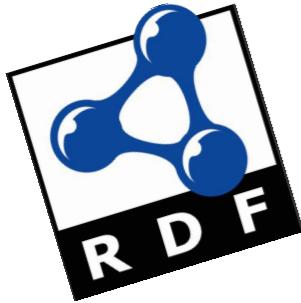

Data Semantics

Stream Linked Data

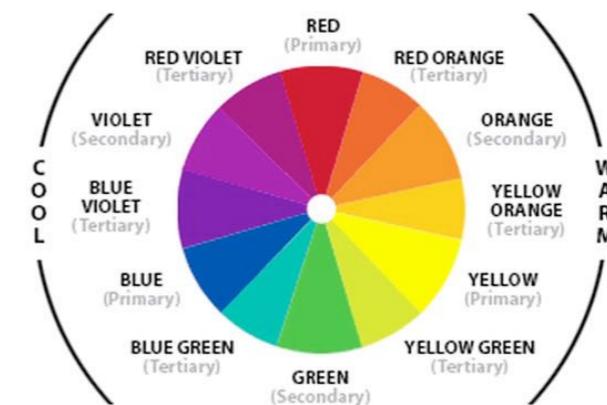

State-of-the-art

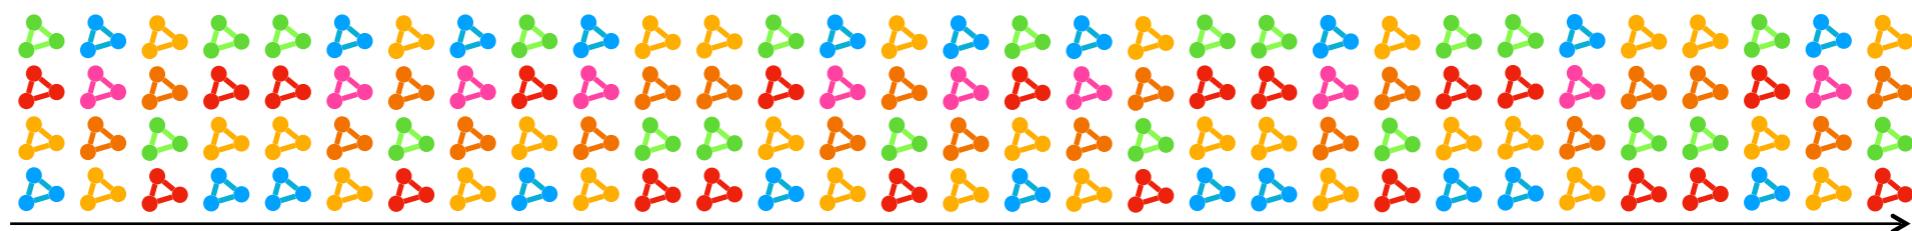

Stream Processing

How many colours in the last minute?

(13), (8), , 8)

1 minute wide window

What the hell is this?

Outline

- Projects
- Processing
 - Systems & Languages
 - Benchmarking

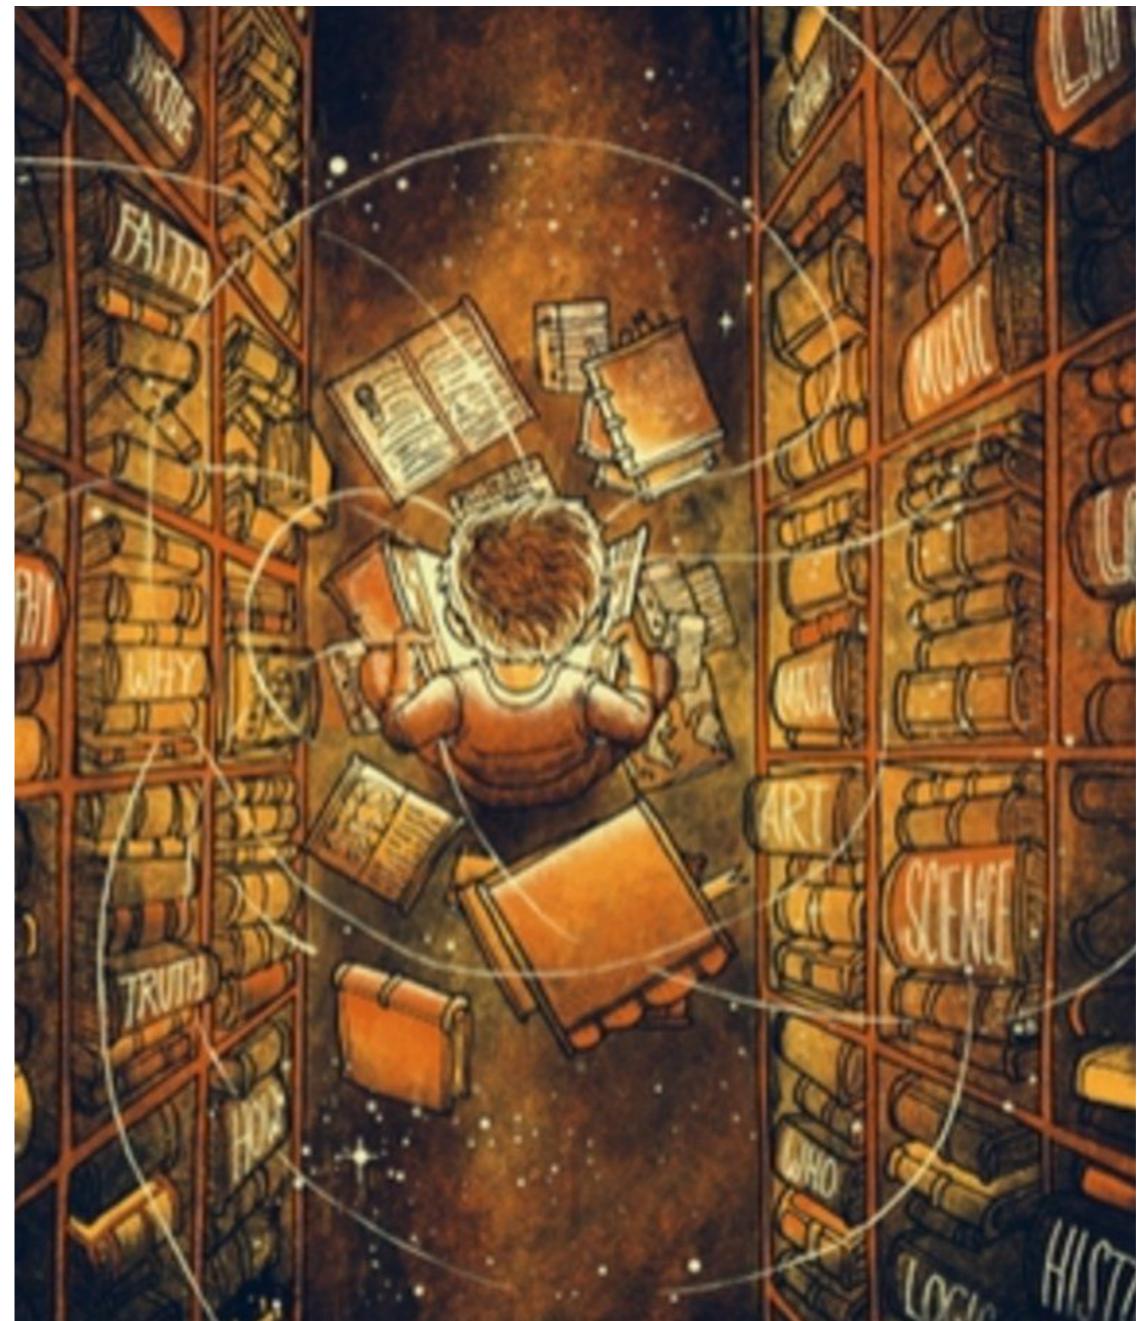

Stream Reasoning Projects

Projet	Year	Deployment	Domain
Bottari	2012	Seul, Korea	Social Media
SLD	2013	London, UK Milan, Italy	Event Management
StarCity	2014	Dublin, Ireland	Smart City
CityPulse	2016	Aarhus, Denmark	Smart City
AgriloT	2016		Smart Farming
Optique	2017	Munich, Germany Stanger, Norway	Manufacturing, Oil Extraction
StreamingMASSIF	2018	Ghent, Belgium	Smart City
CitySensing	2019	Milan, Italy	Smart City

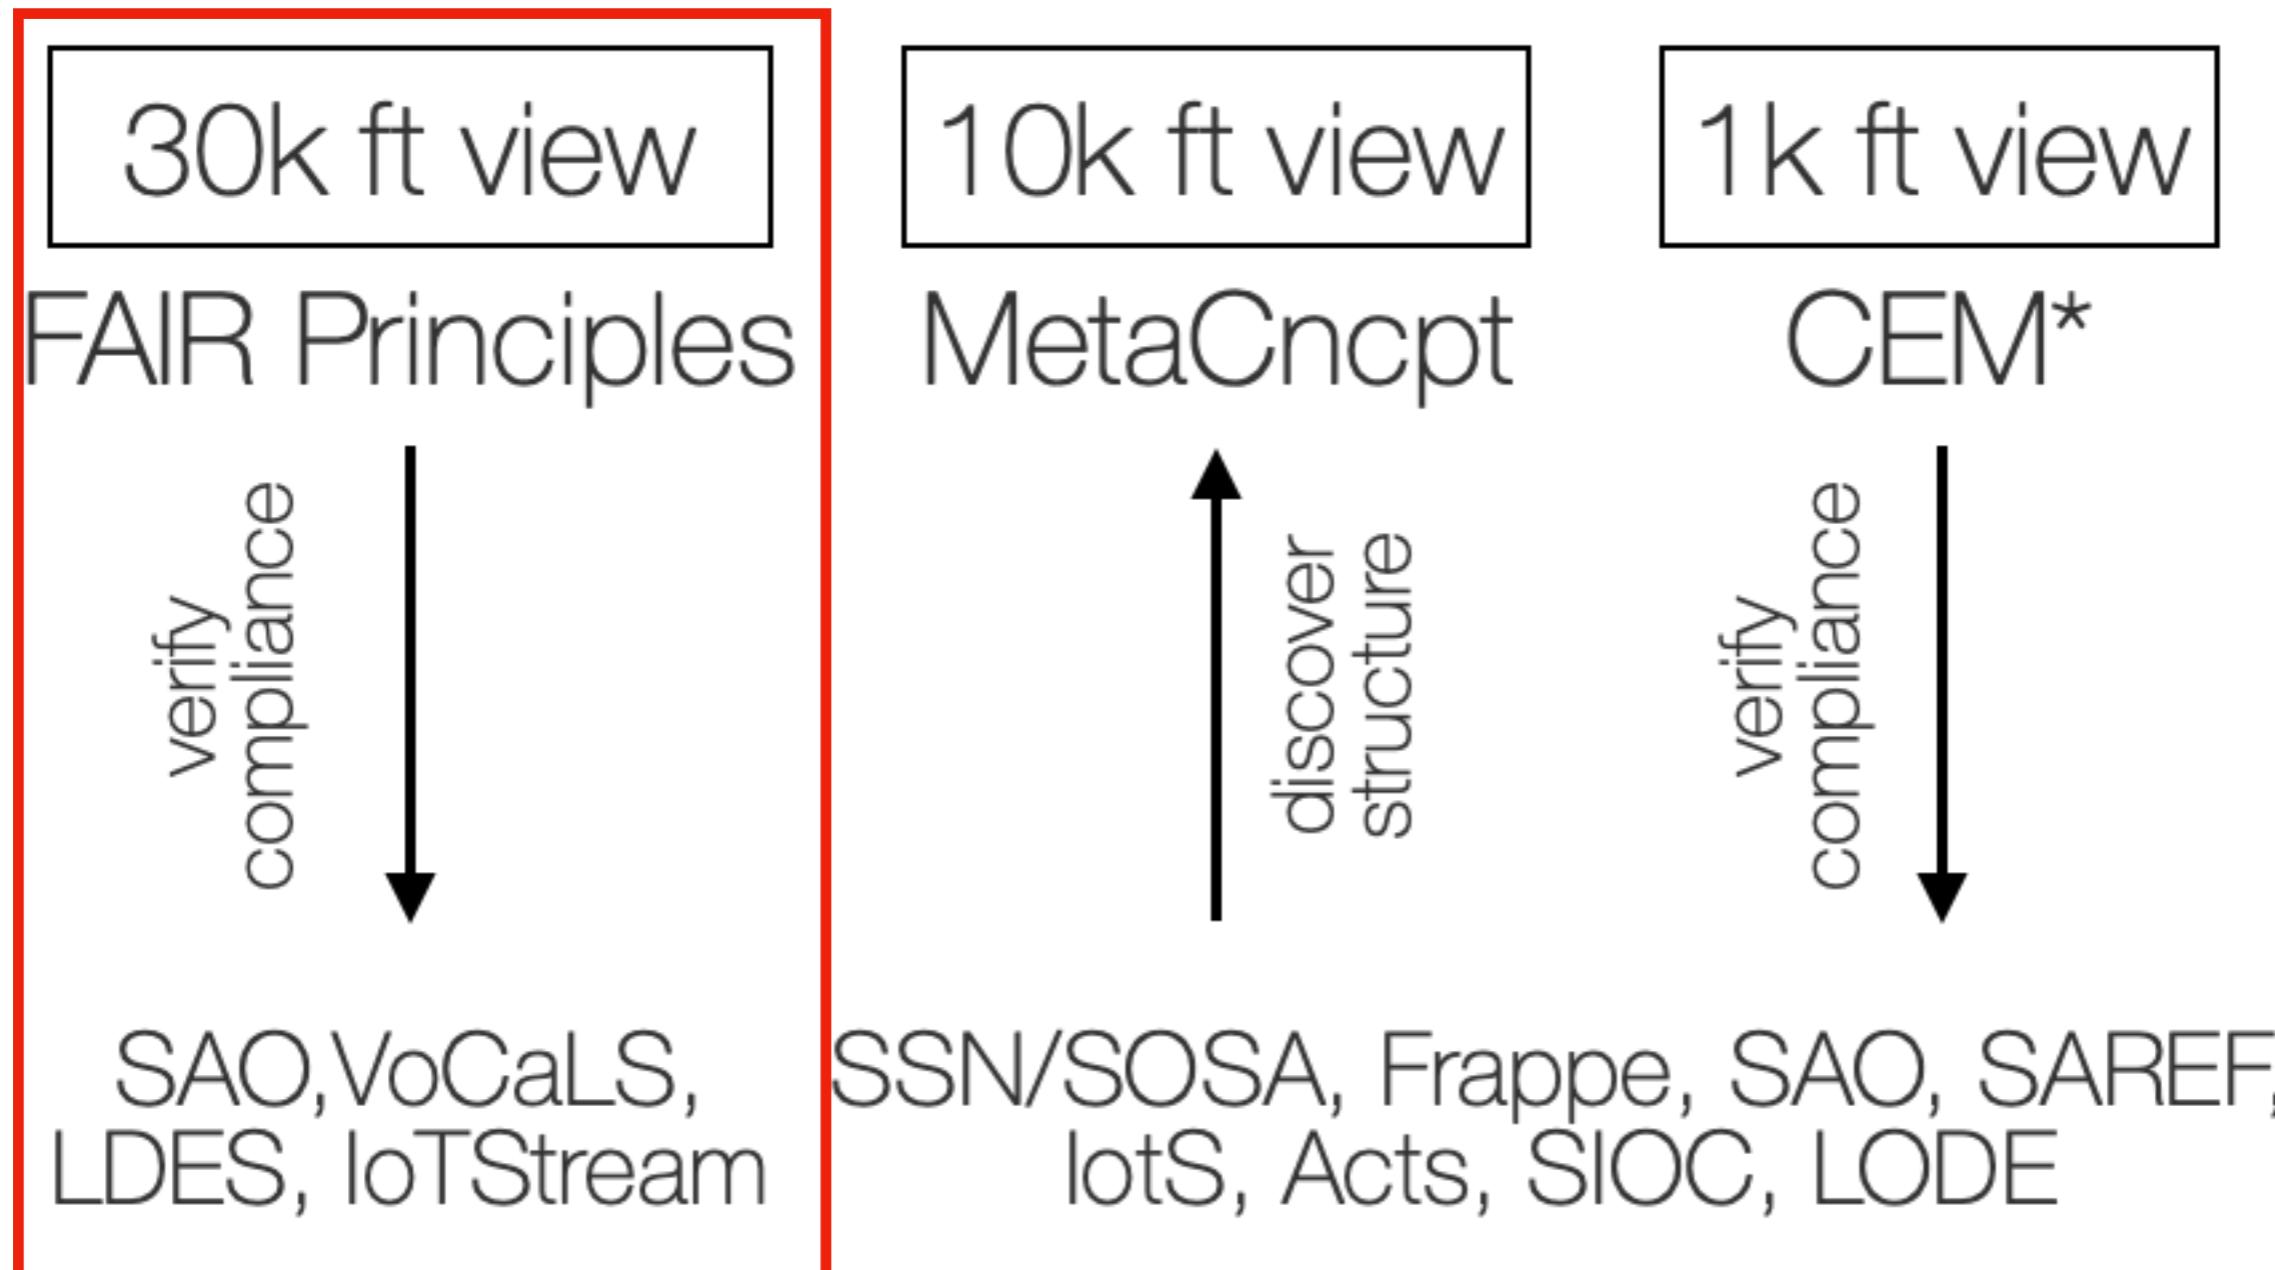

Table 1
Summary of the Selected Projects.

Ontologies for Stream Reasoning

- We surveys the knowledge representation efforts in the aforementioned projects and more
- we identified 10 ontologies and we study their organisation
- finding and best practices observation are currently under review

Three Perspectives

FAIR Principles

- FINDABLE
- ACCESSIBLE
- INTEROPERABLE
- REUSABLE

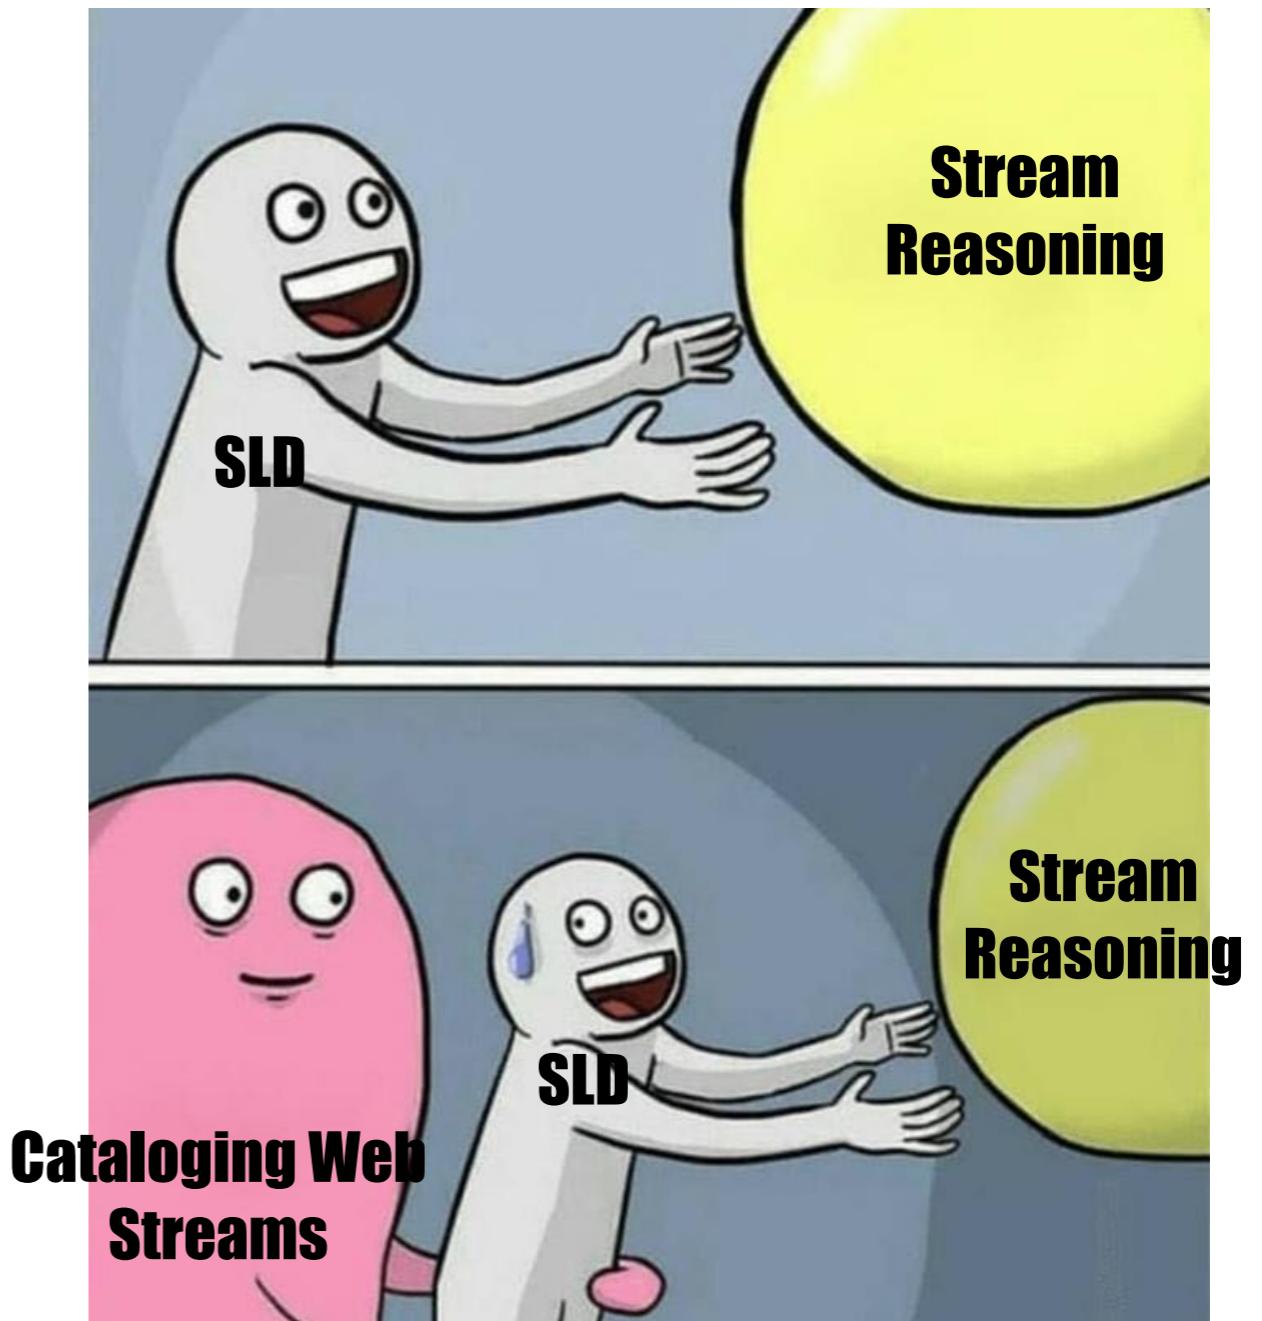

Analysis

- A community efforts for finding streams and making them Accessible
- A question for us: what is preventing people to make their stream available?
- Relates to decentralisation initiative, cf SOLID.

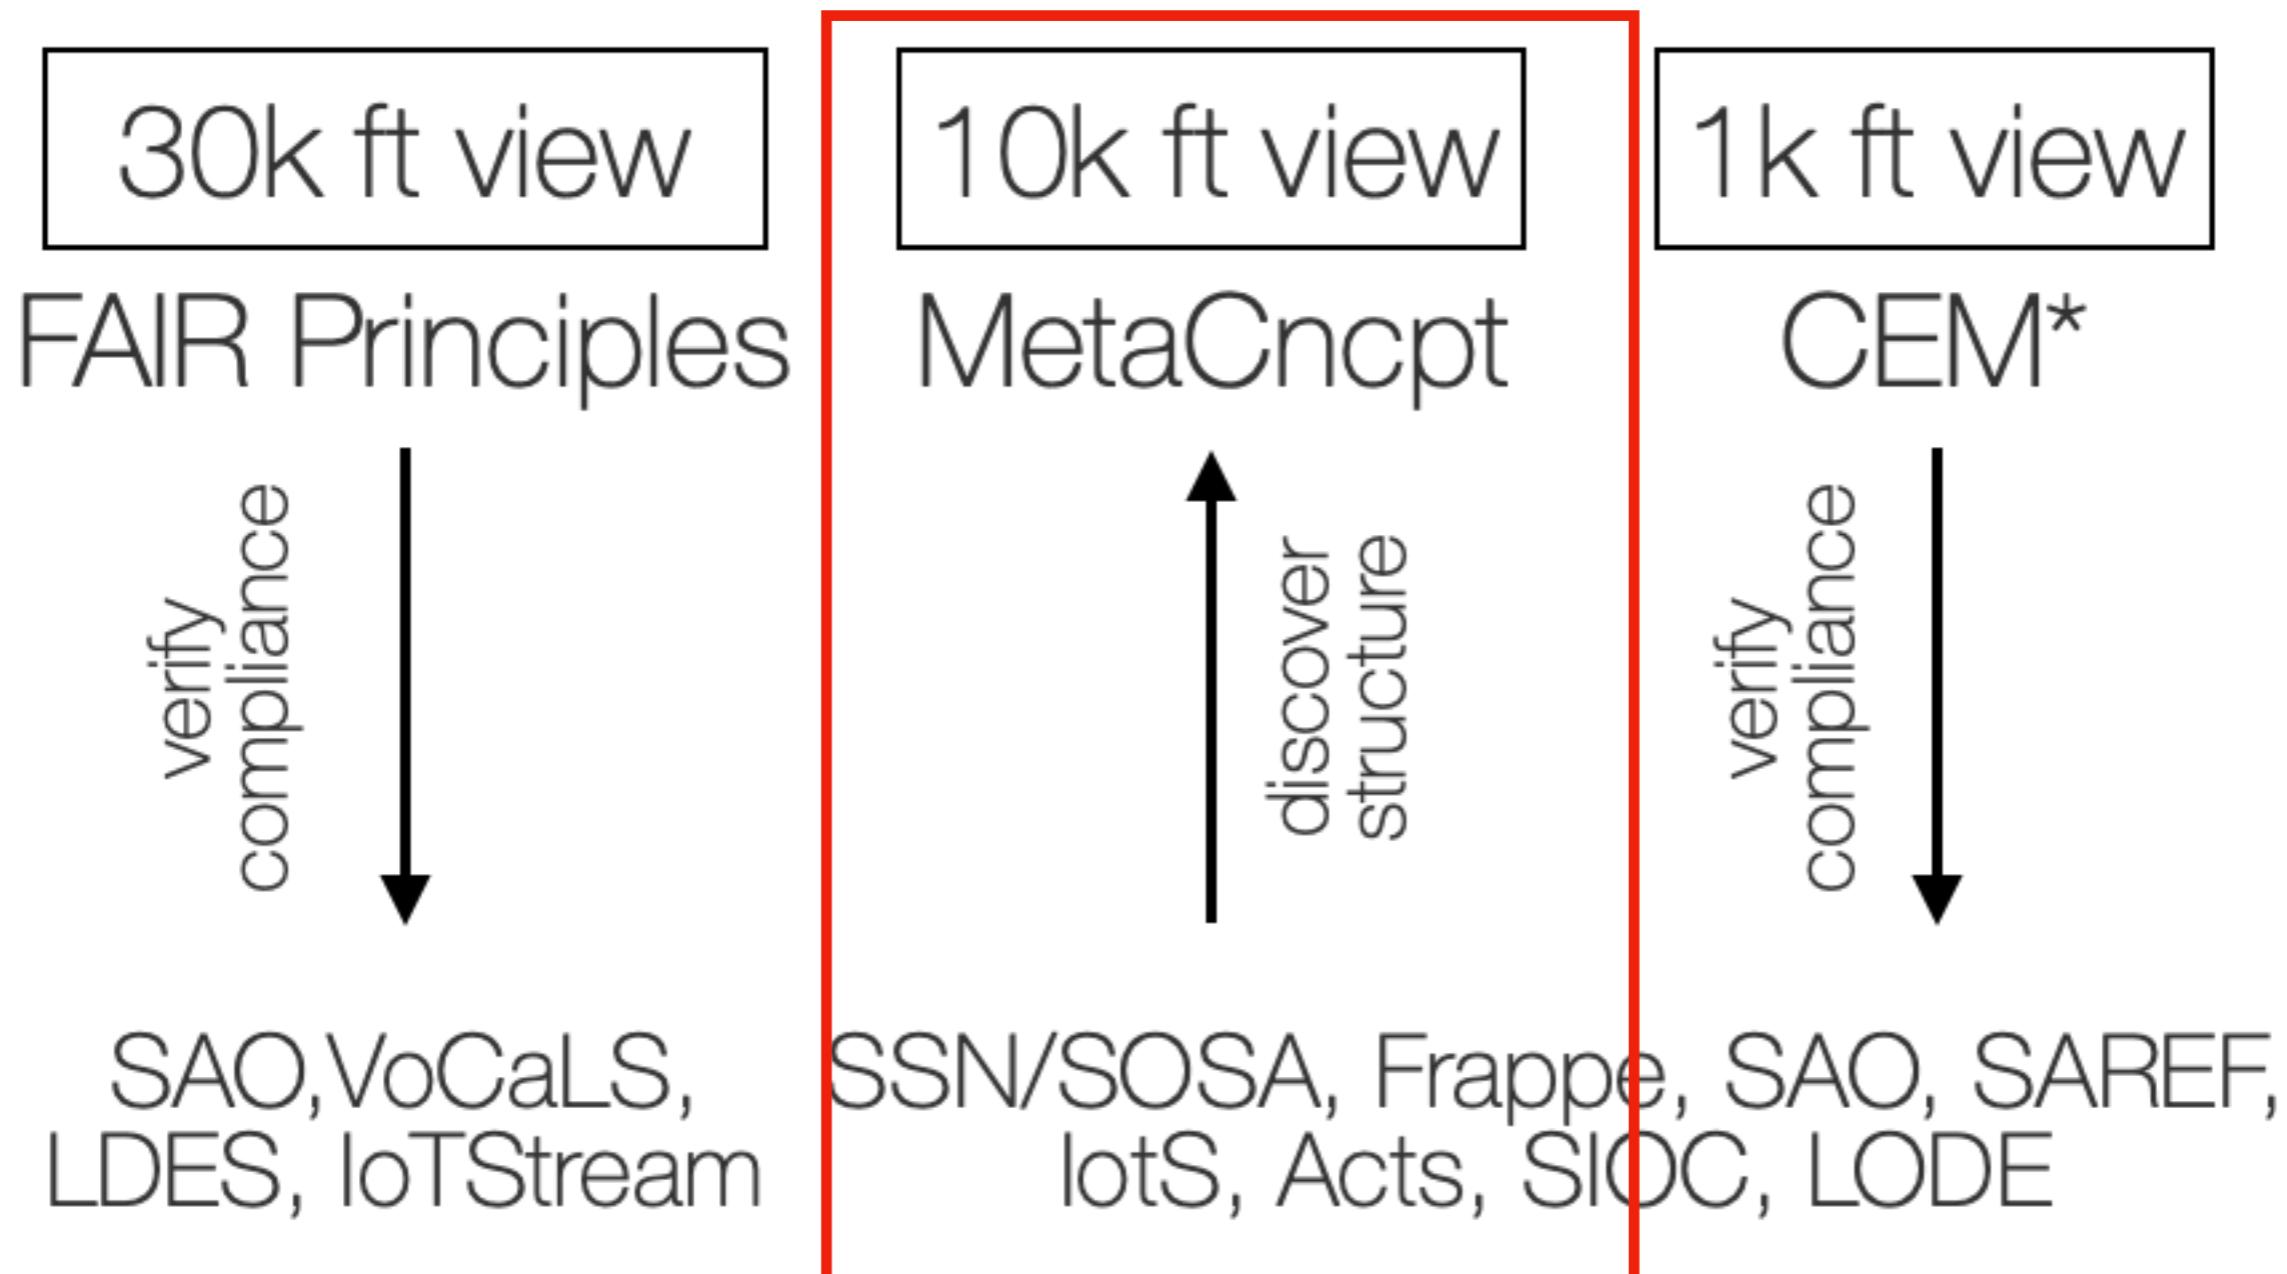

Cataloging Web Streams

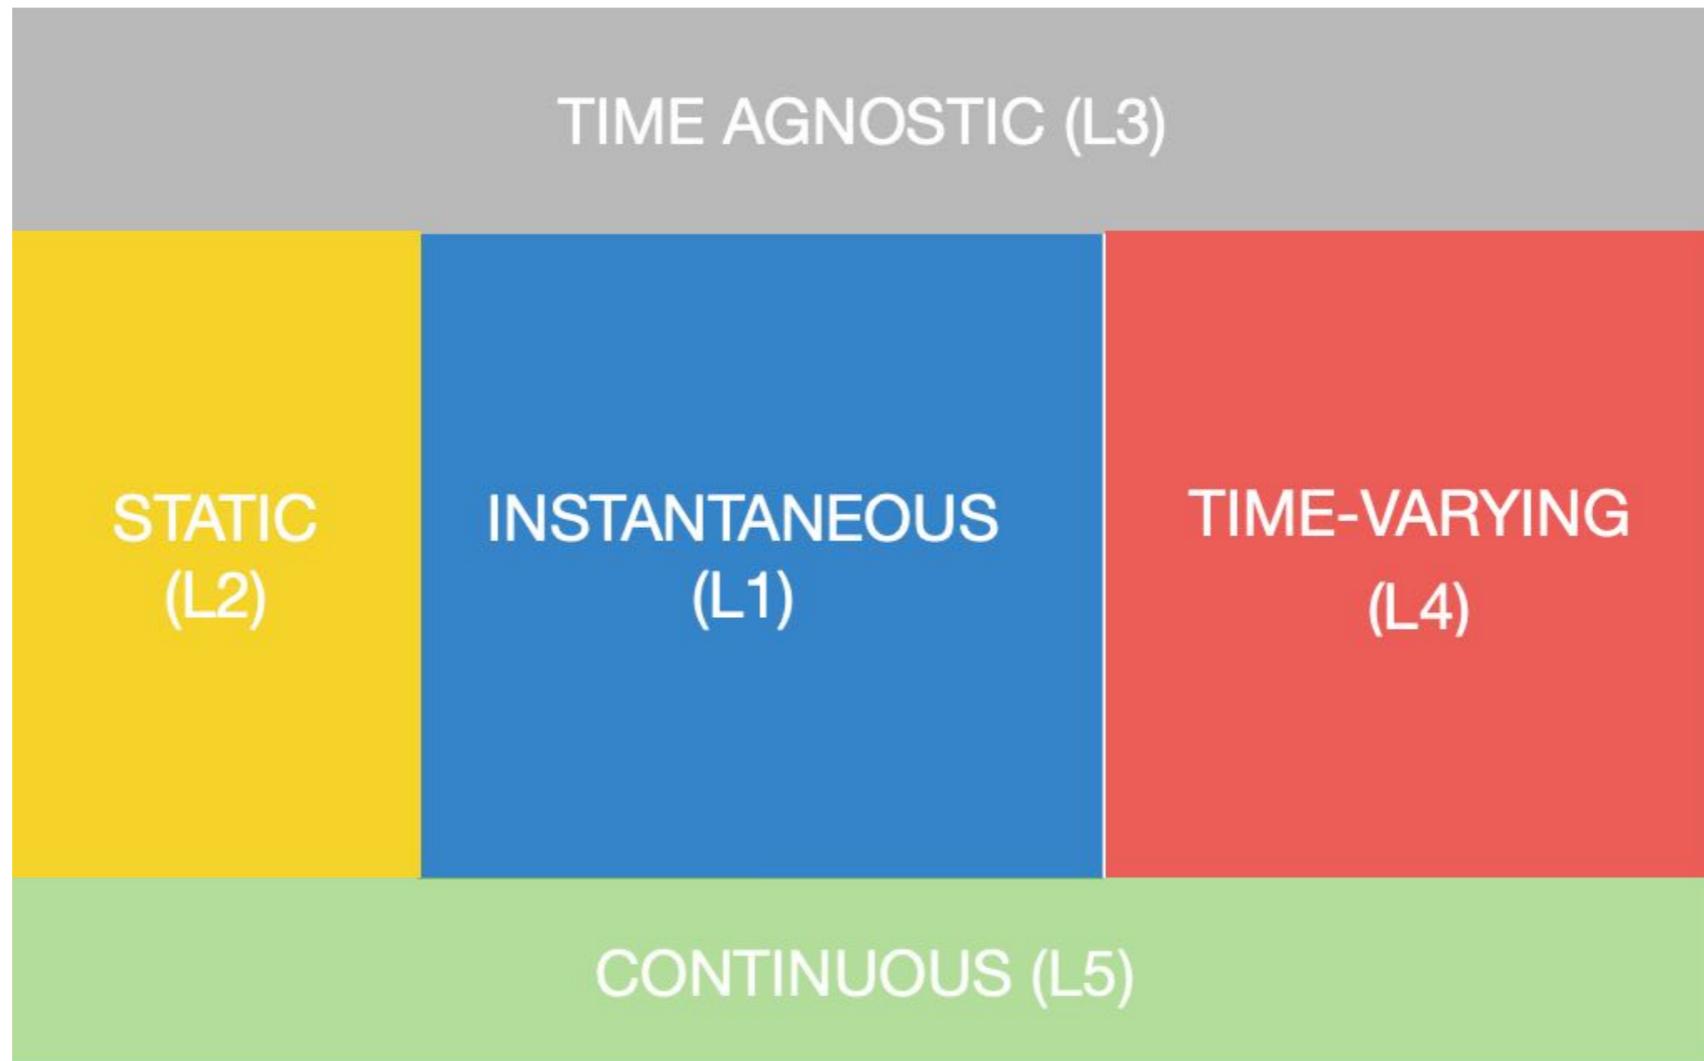

- SR projects assumed that KR languages like OWL/RDFS were enough
- Recent years have shown lots of interesting results on temporal logics for stream reasoning
- We still lack a dedicated KR methodology

Three Perspectives

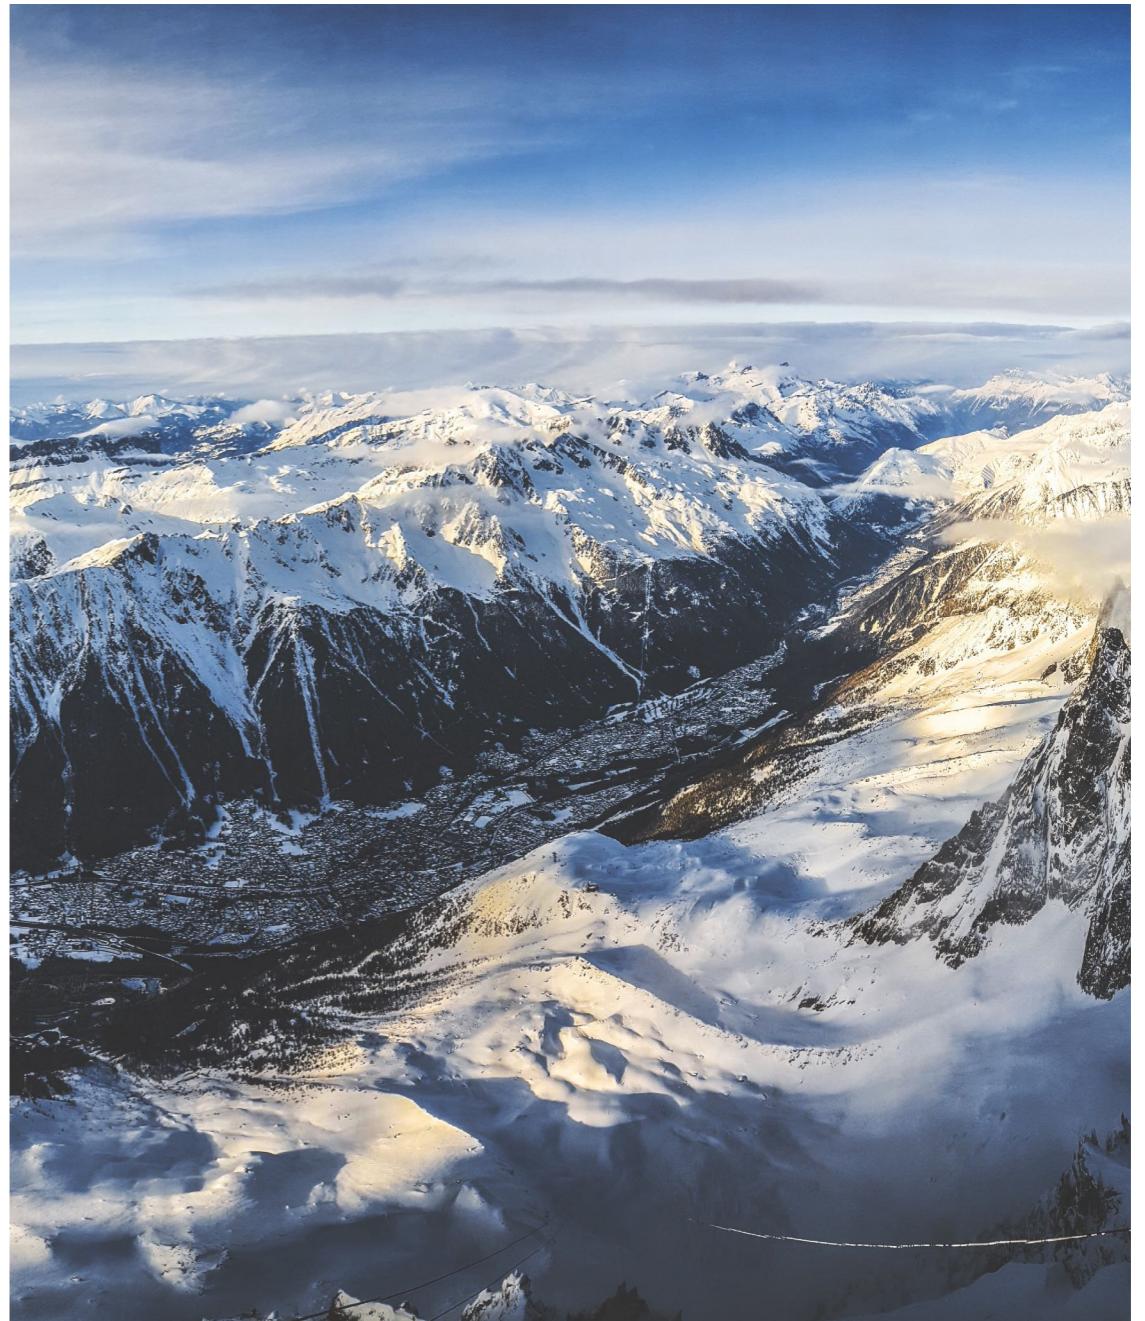

10k ft View

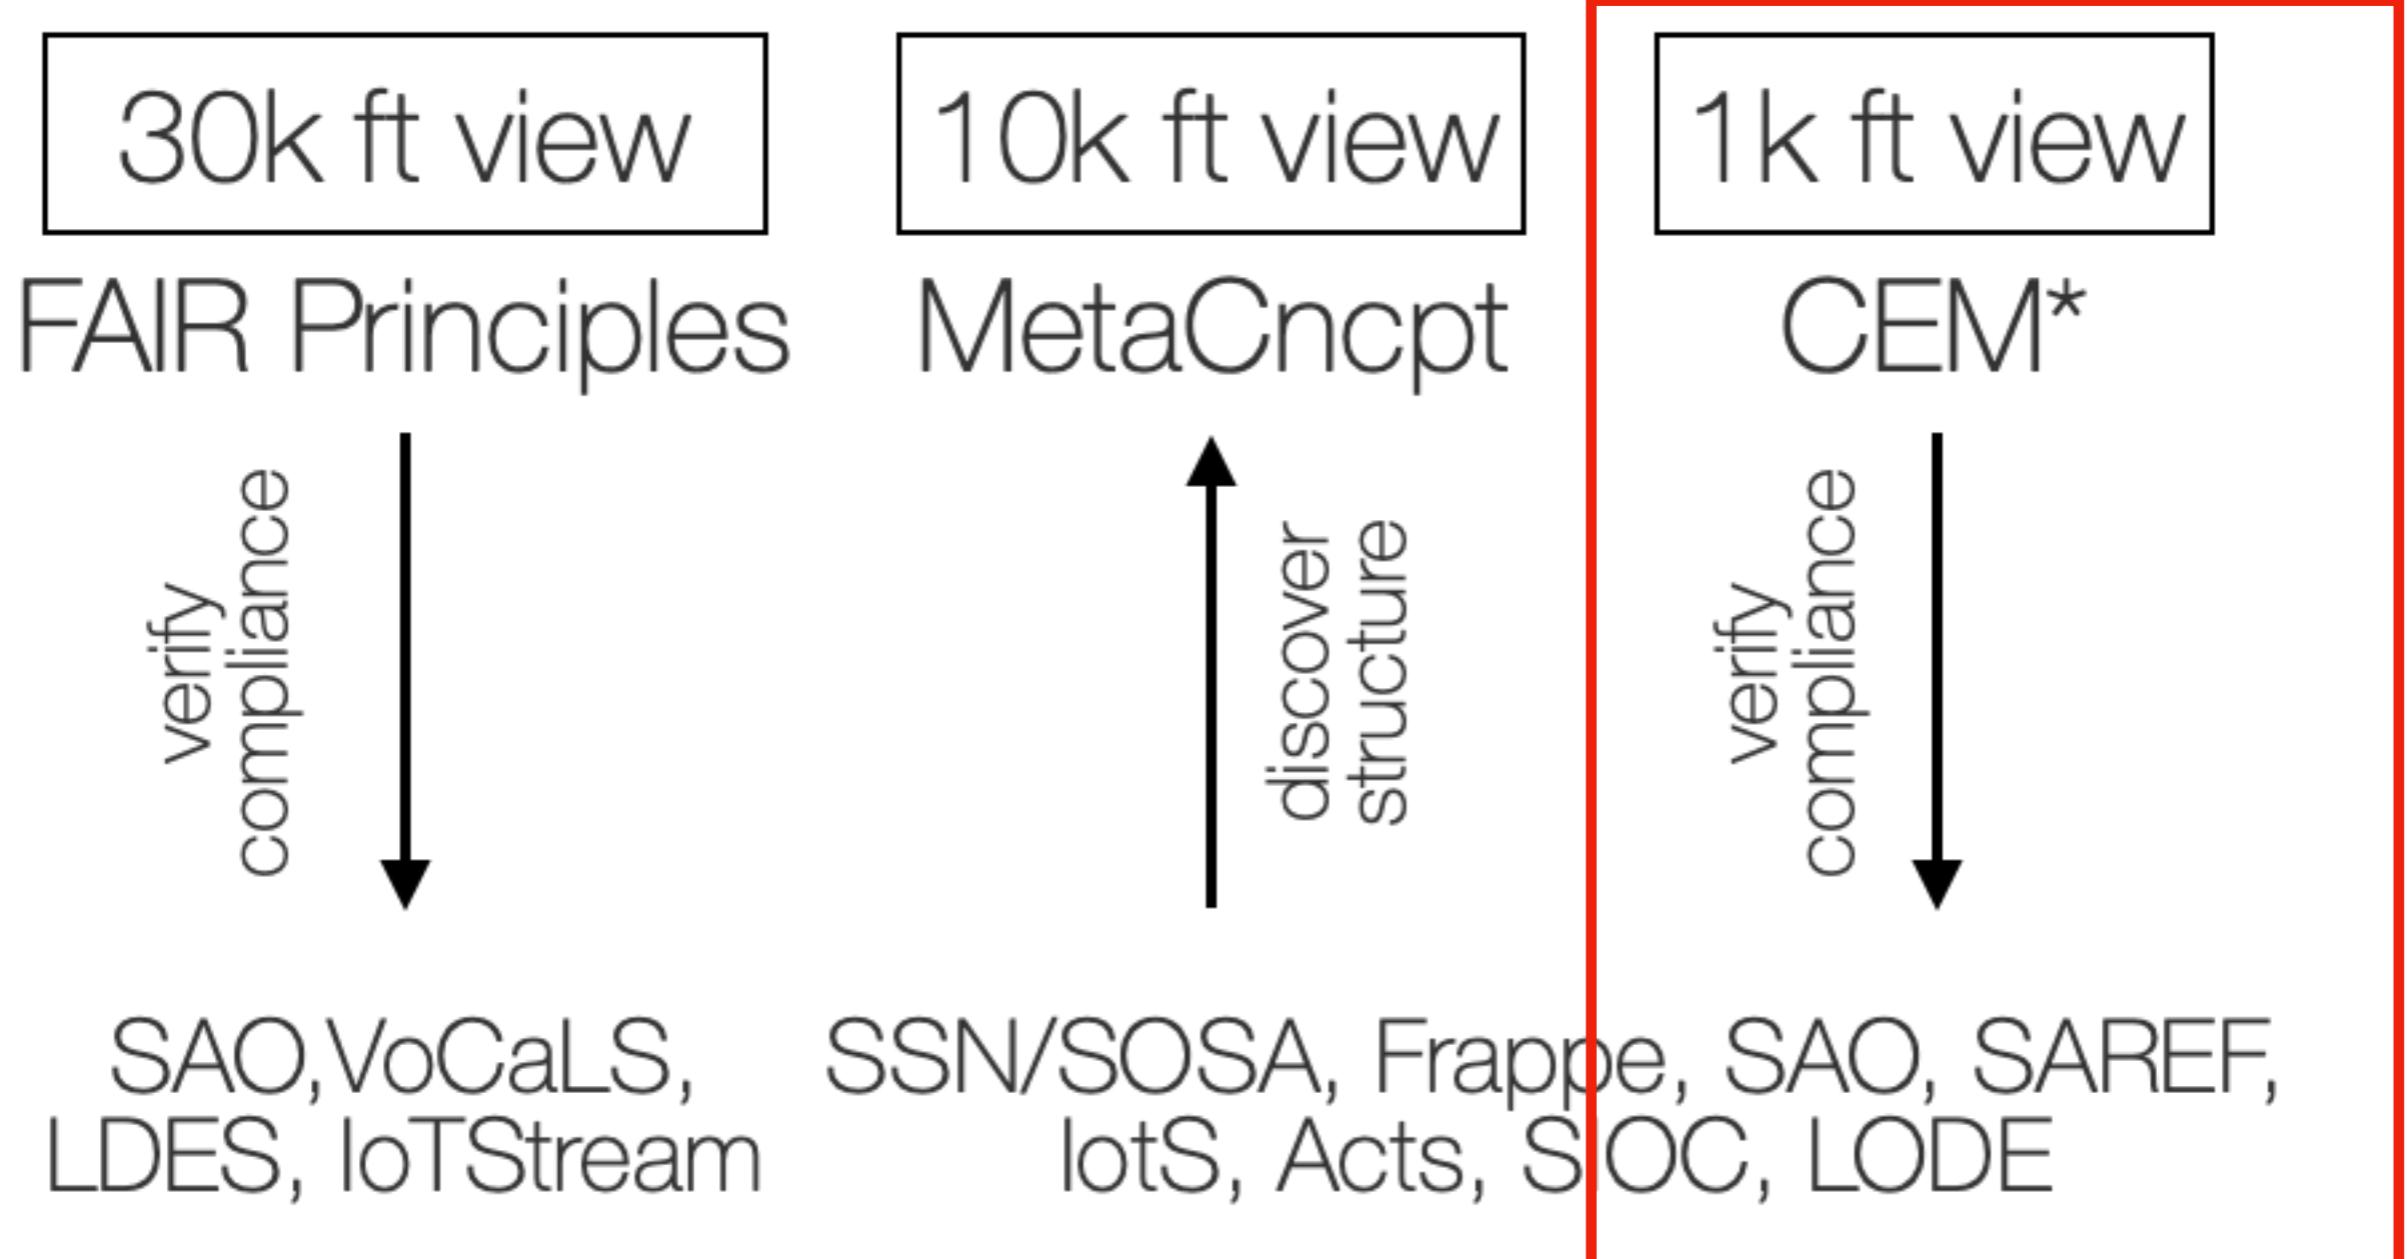

Analysis

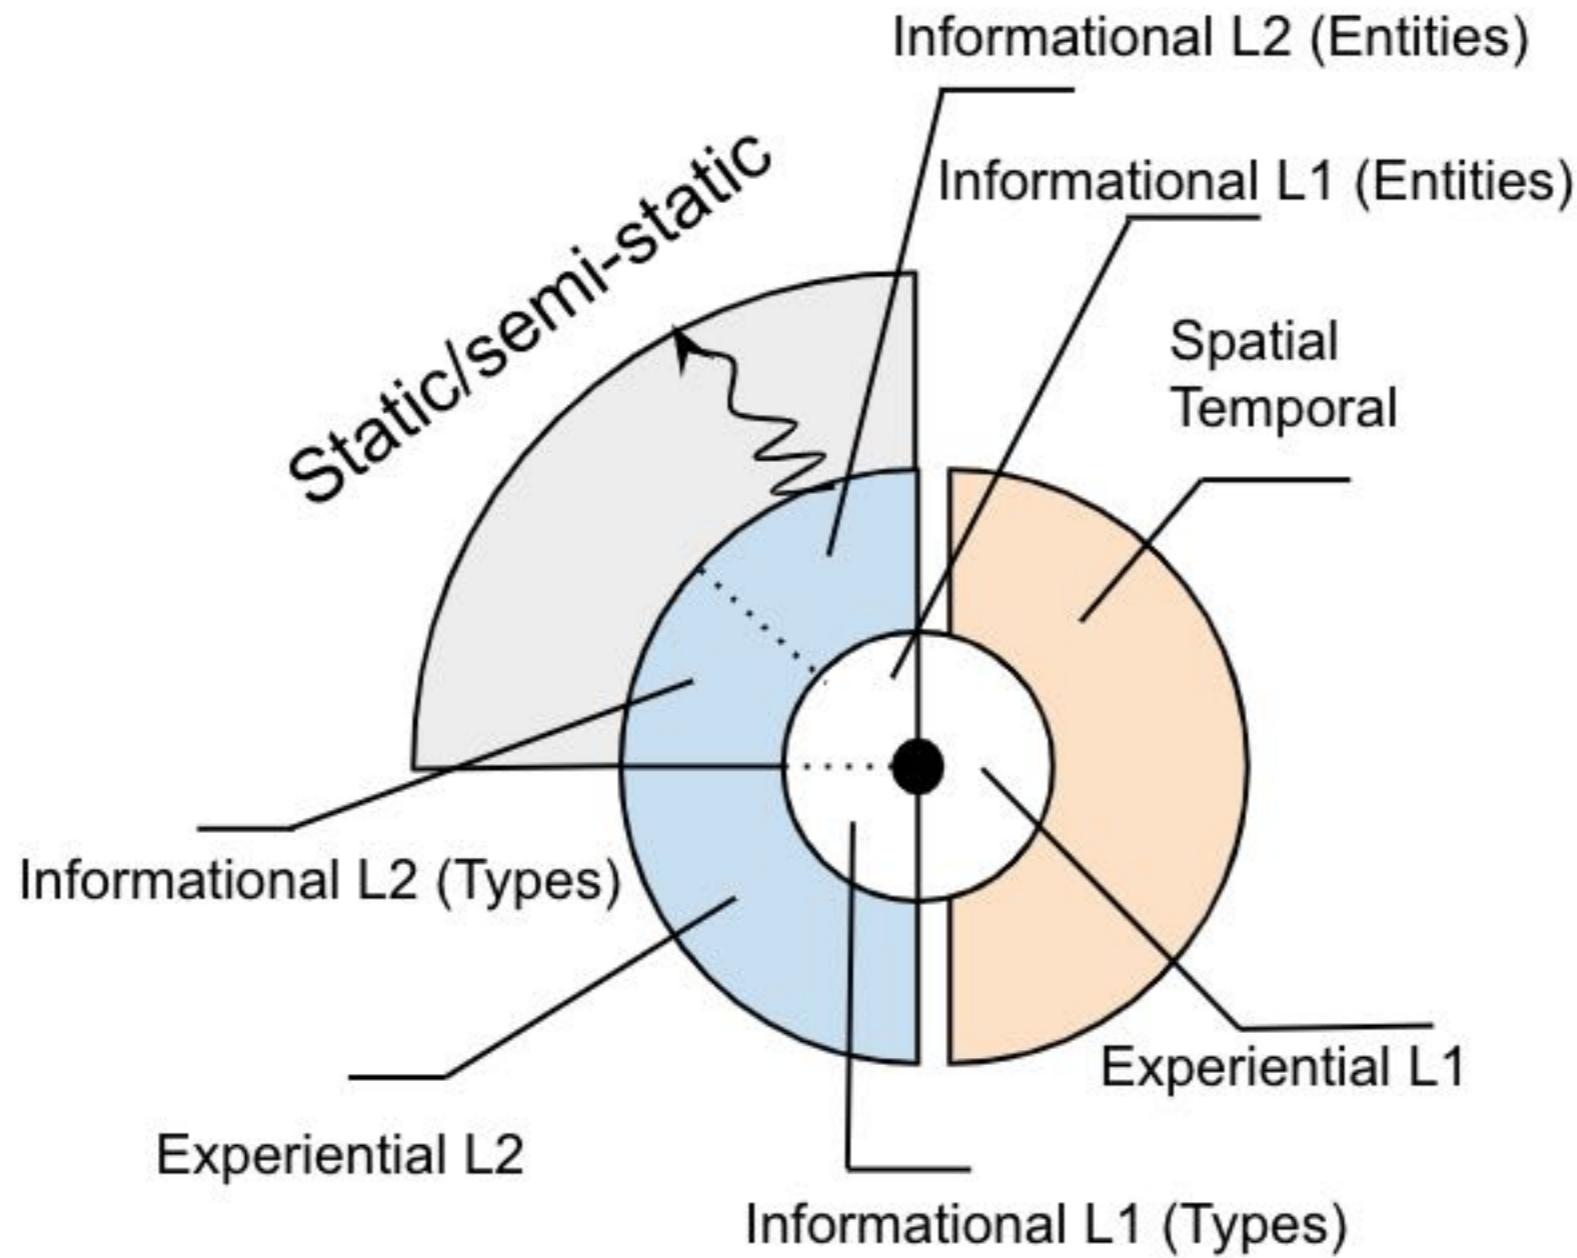

- Ontologies distribute the modelling complexity across different temporal levels
- The goal is facilitate the alignment with applications
- What KR Method do they use?

Three Perspectives

1k ft View

Analysis

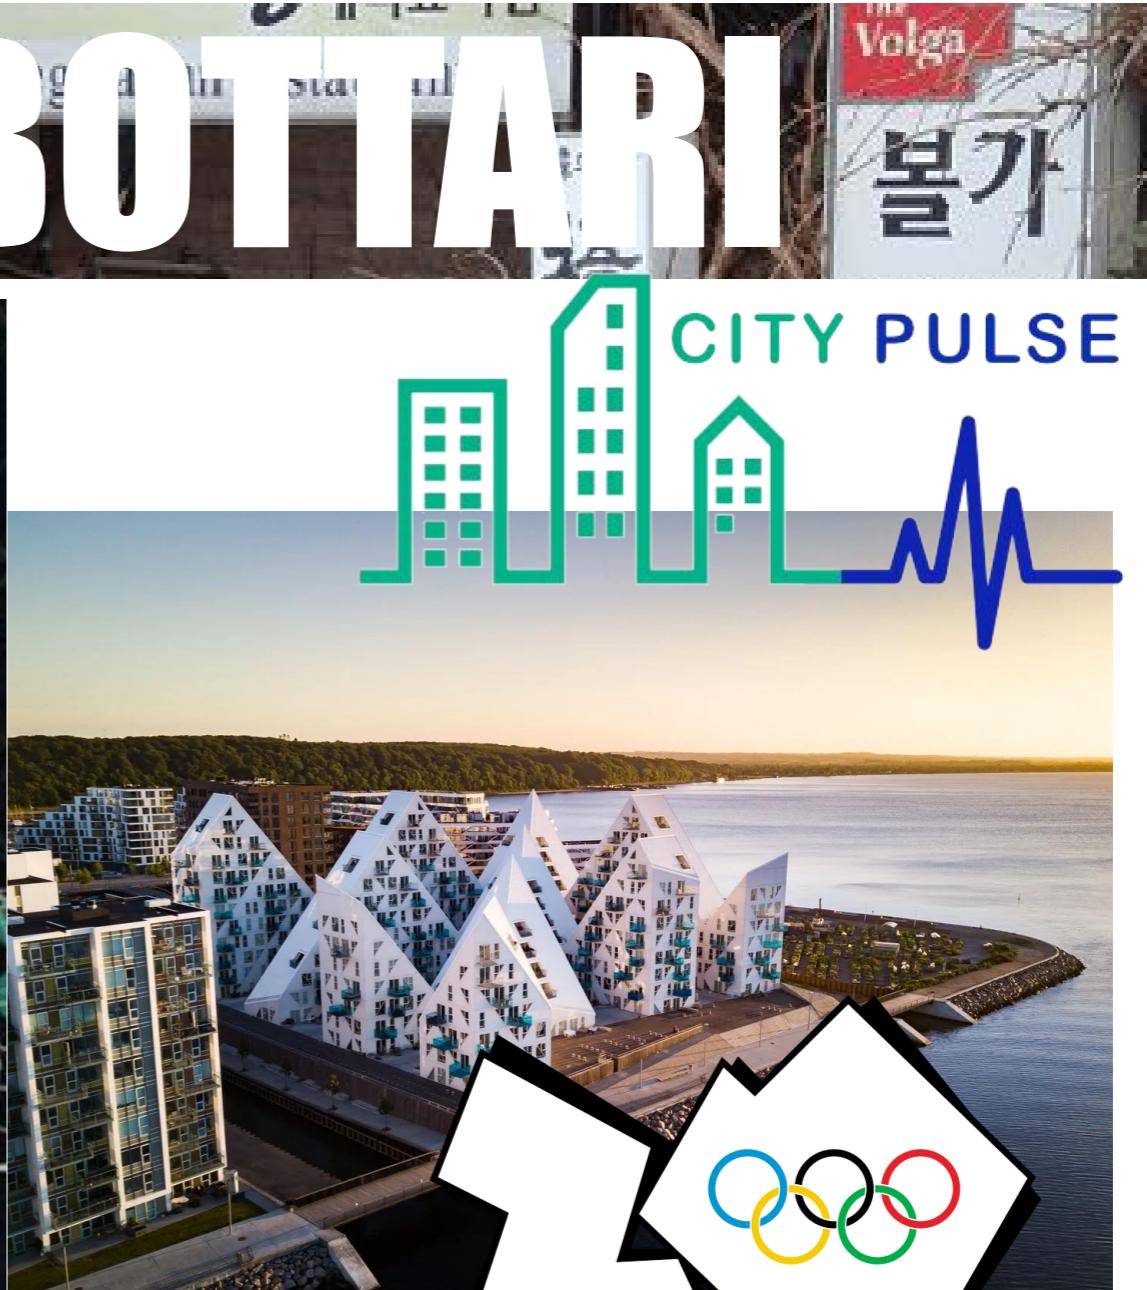

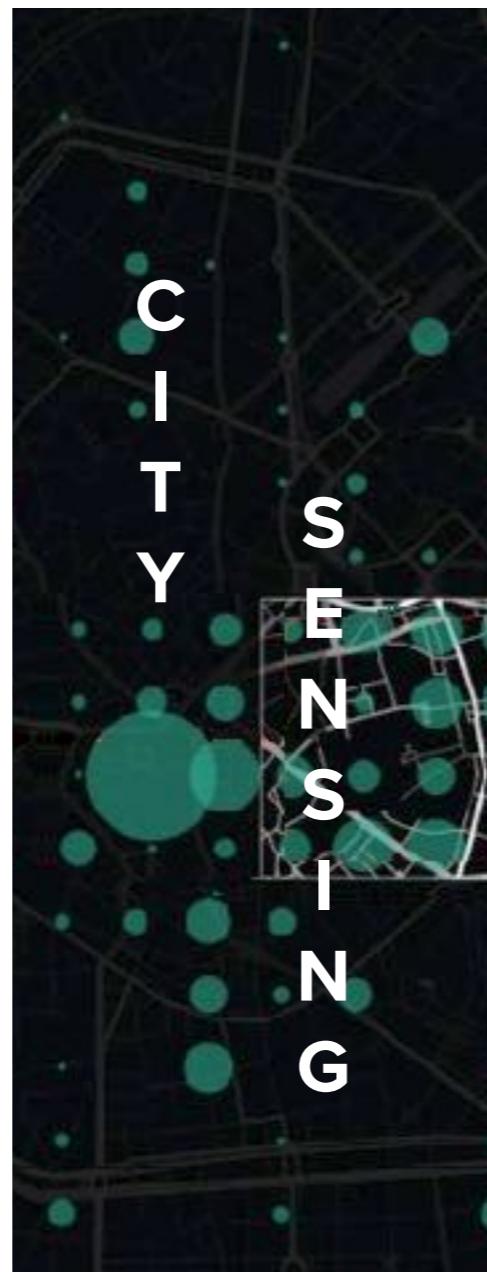

- Ontologies keep their kernel small
- This is because the the further away from the kernel, the more static the data.
- What KR method did they use?

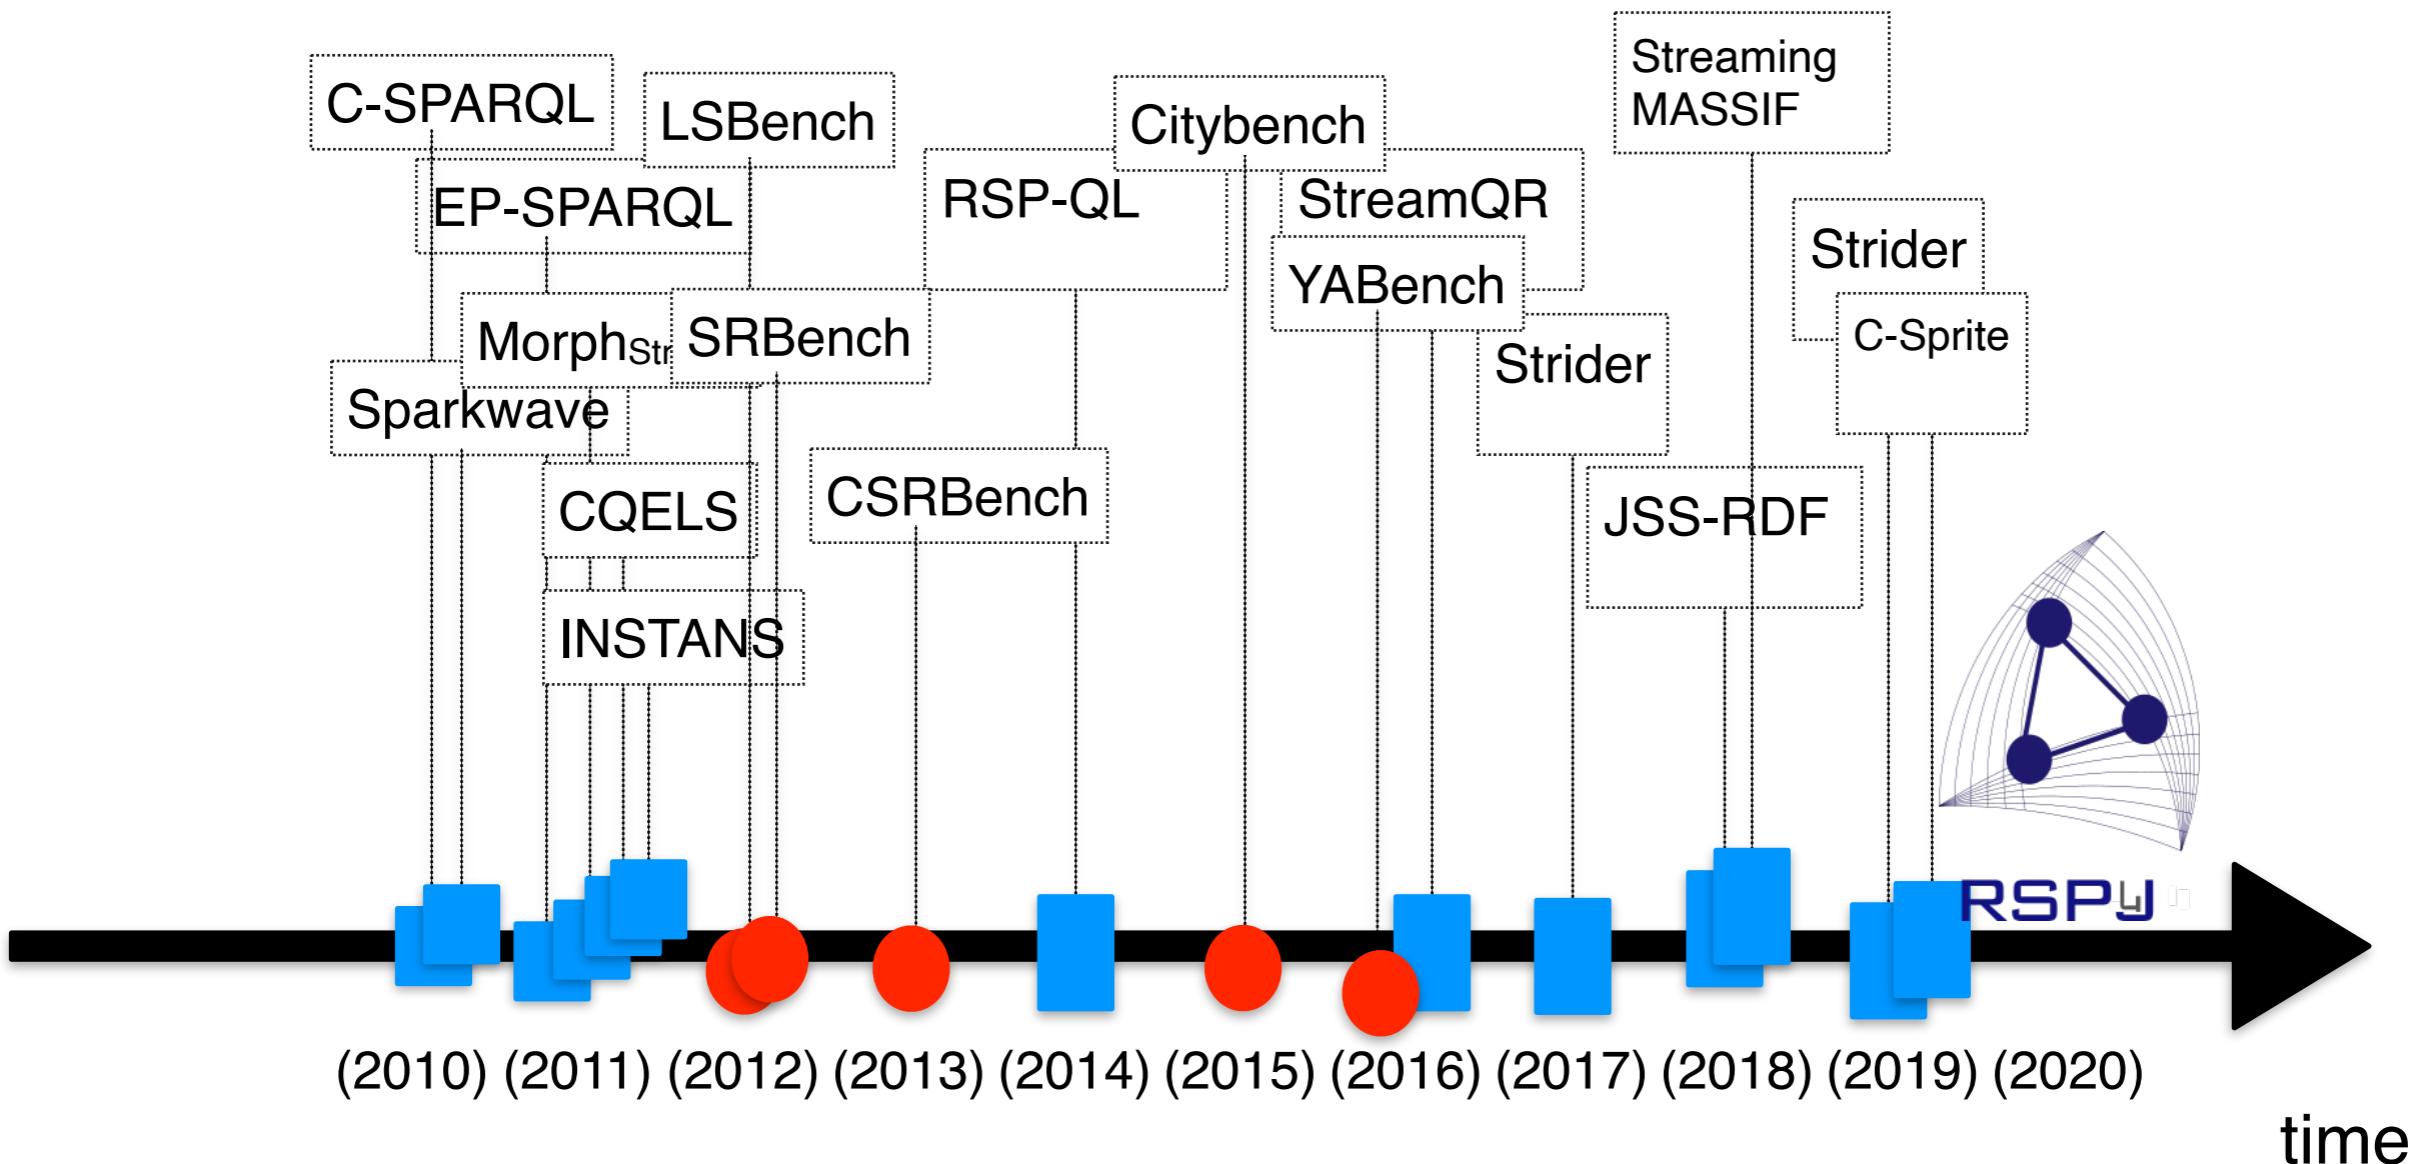

Representing Ephemeral Knowledge

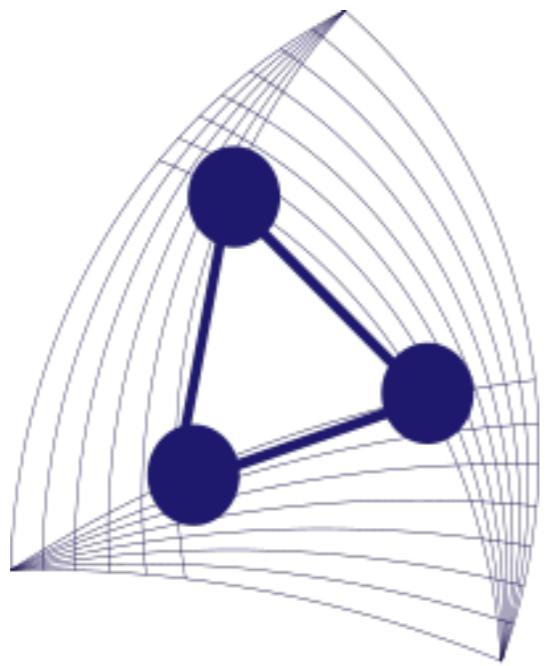

- SR projects assumed that KR languages like OWL/RDFS were enough
- Recent years have shown lots of interesting results on temporal logics for stream reasoning
- We still lack a dedicated KR methodology

RSP Systems & Languages

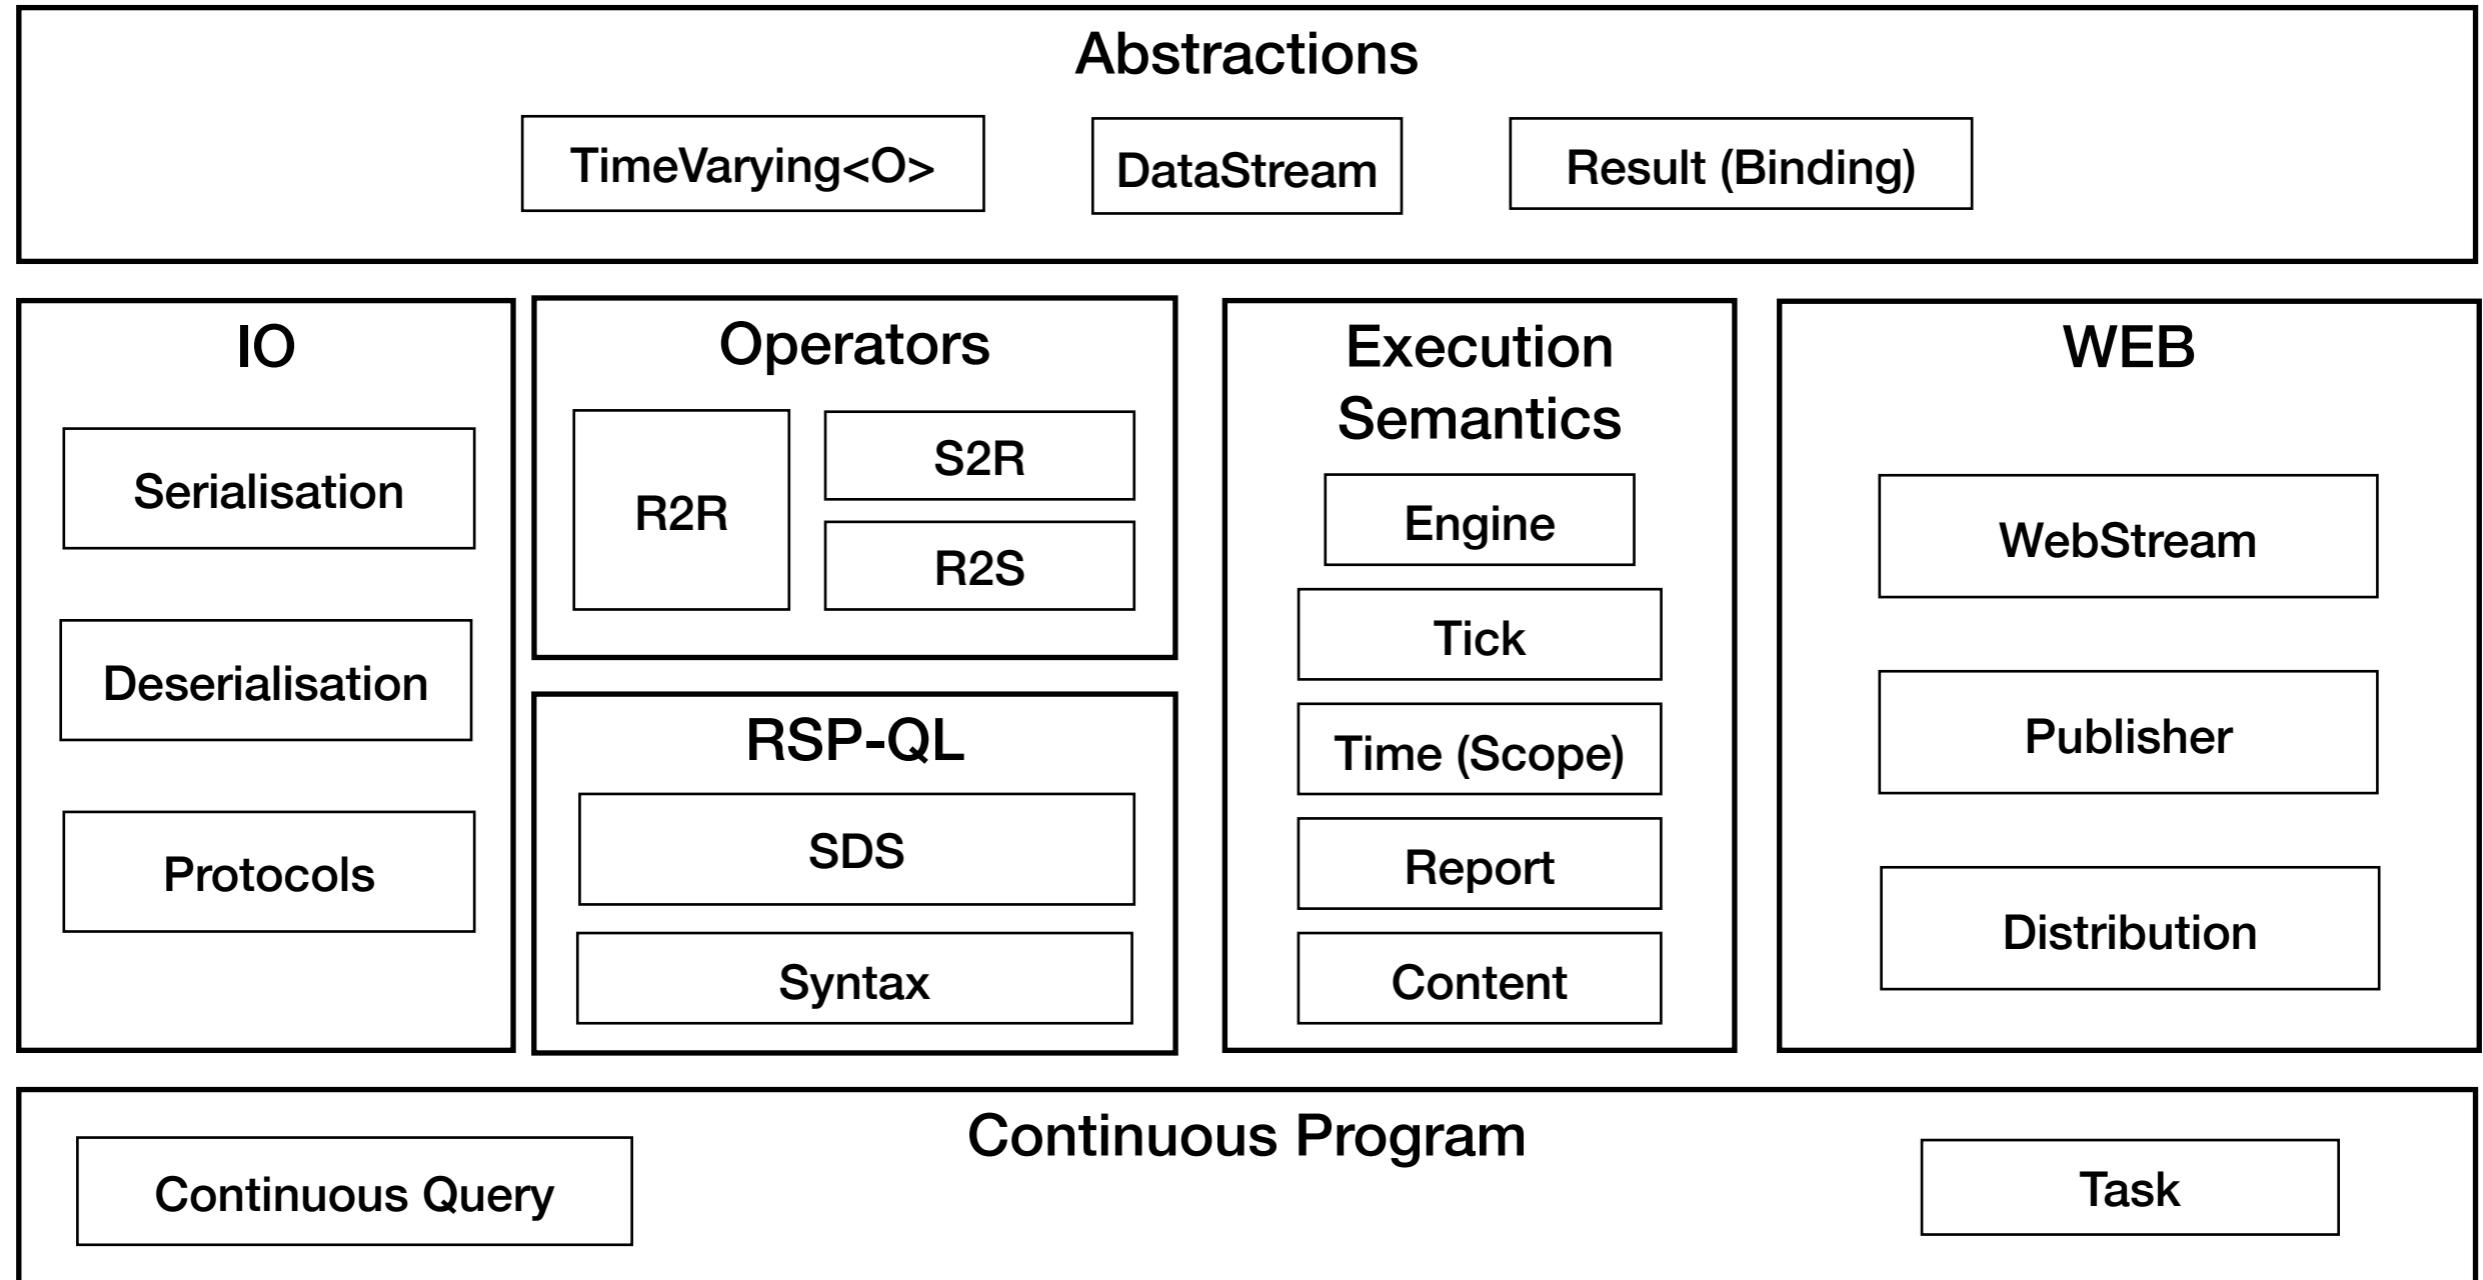

RSP₄

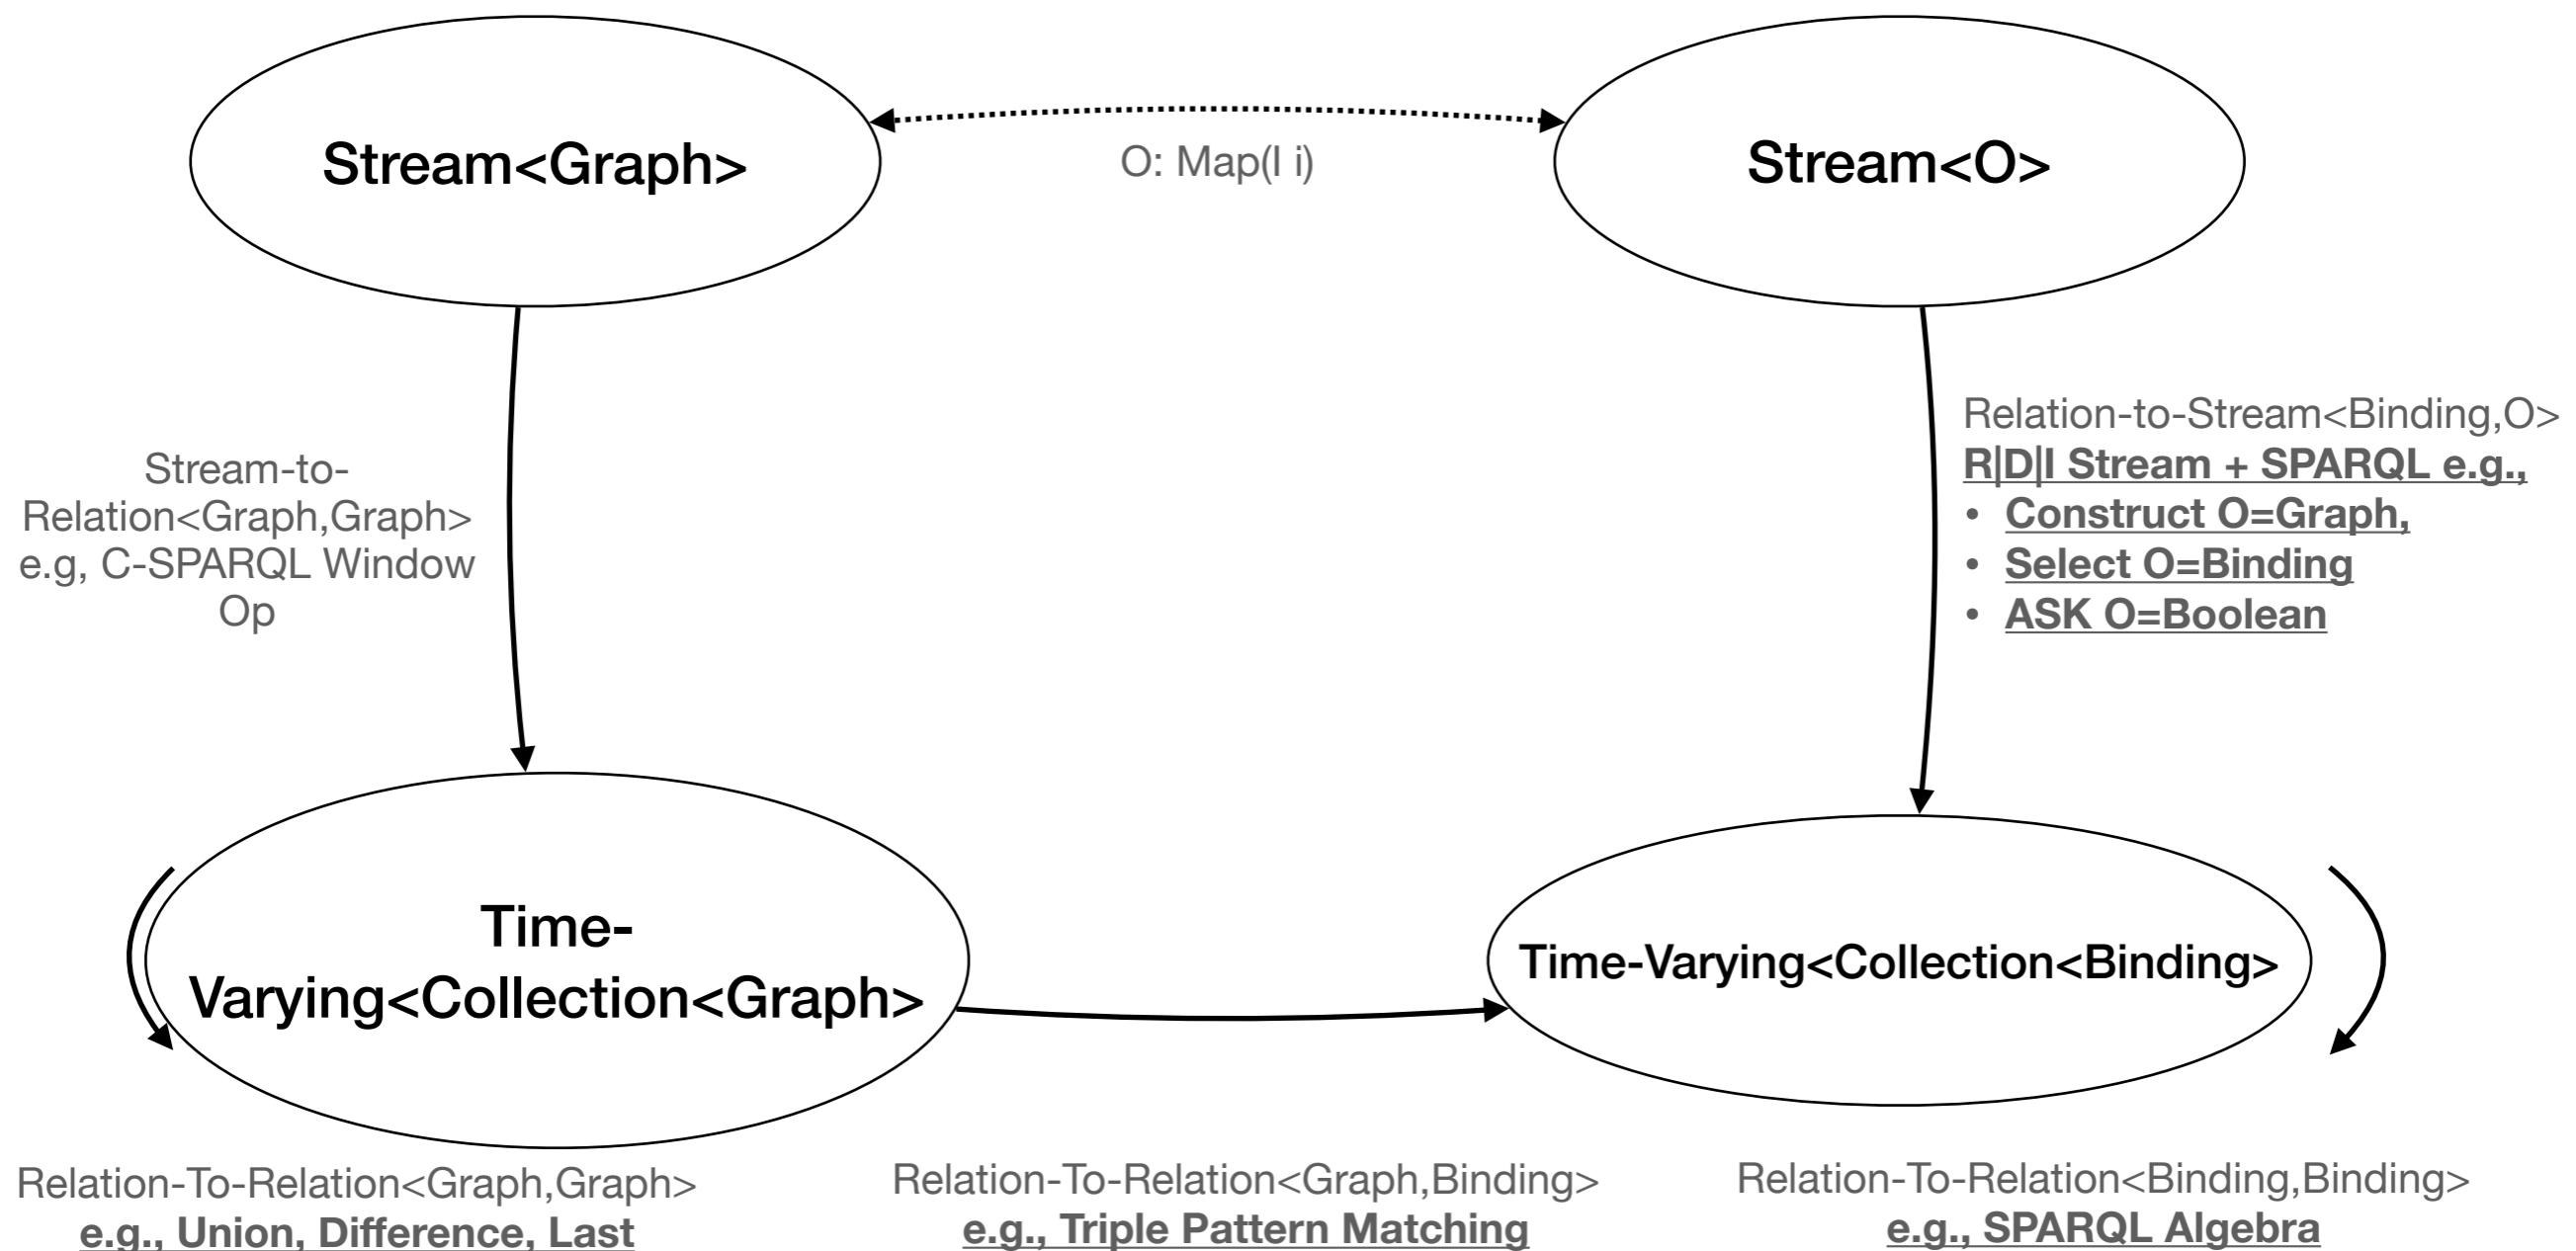

A library for RSP fast
prototyping
based on RSP-QL

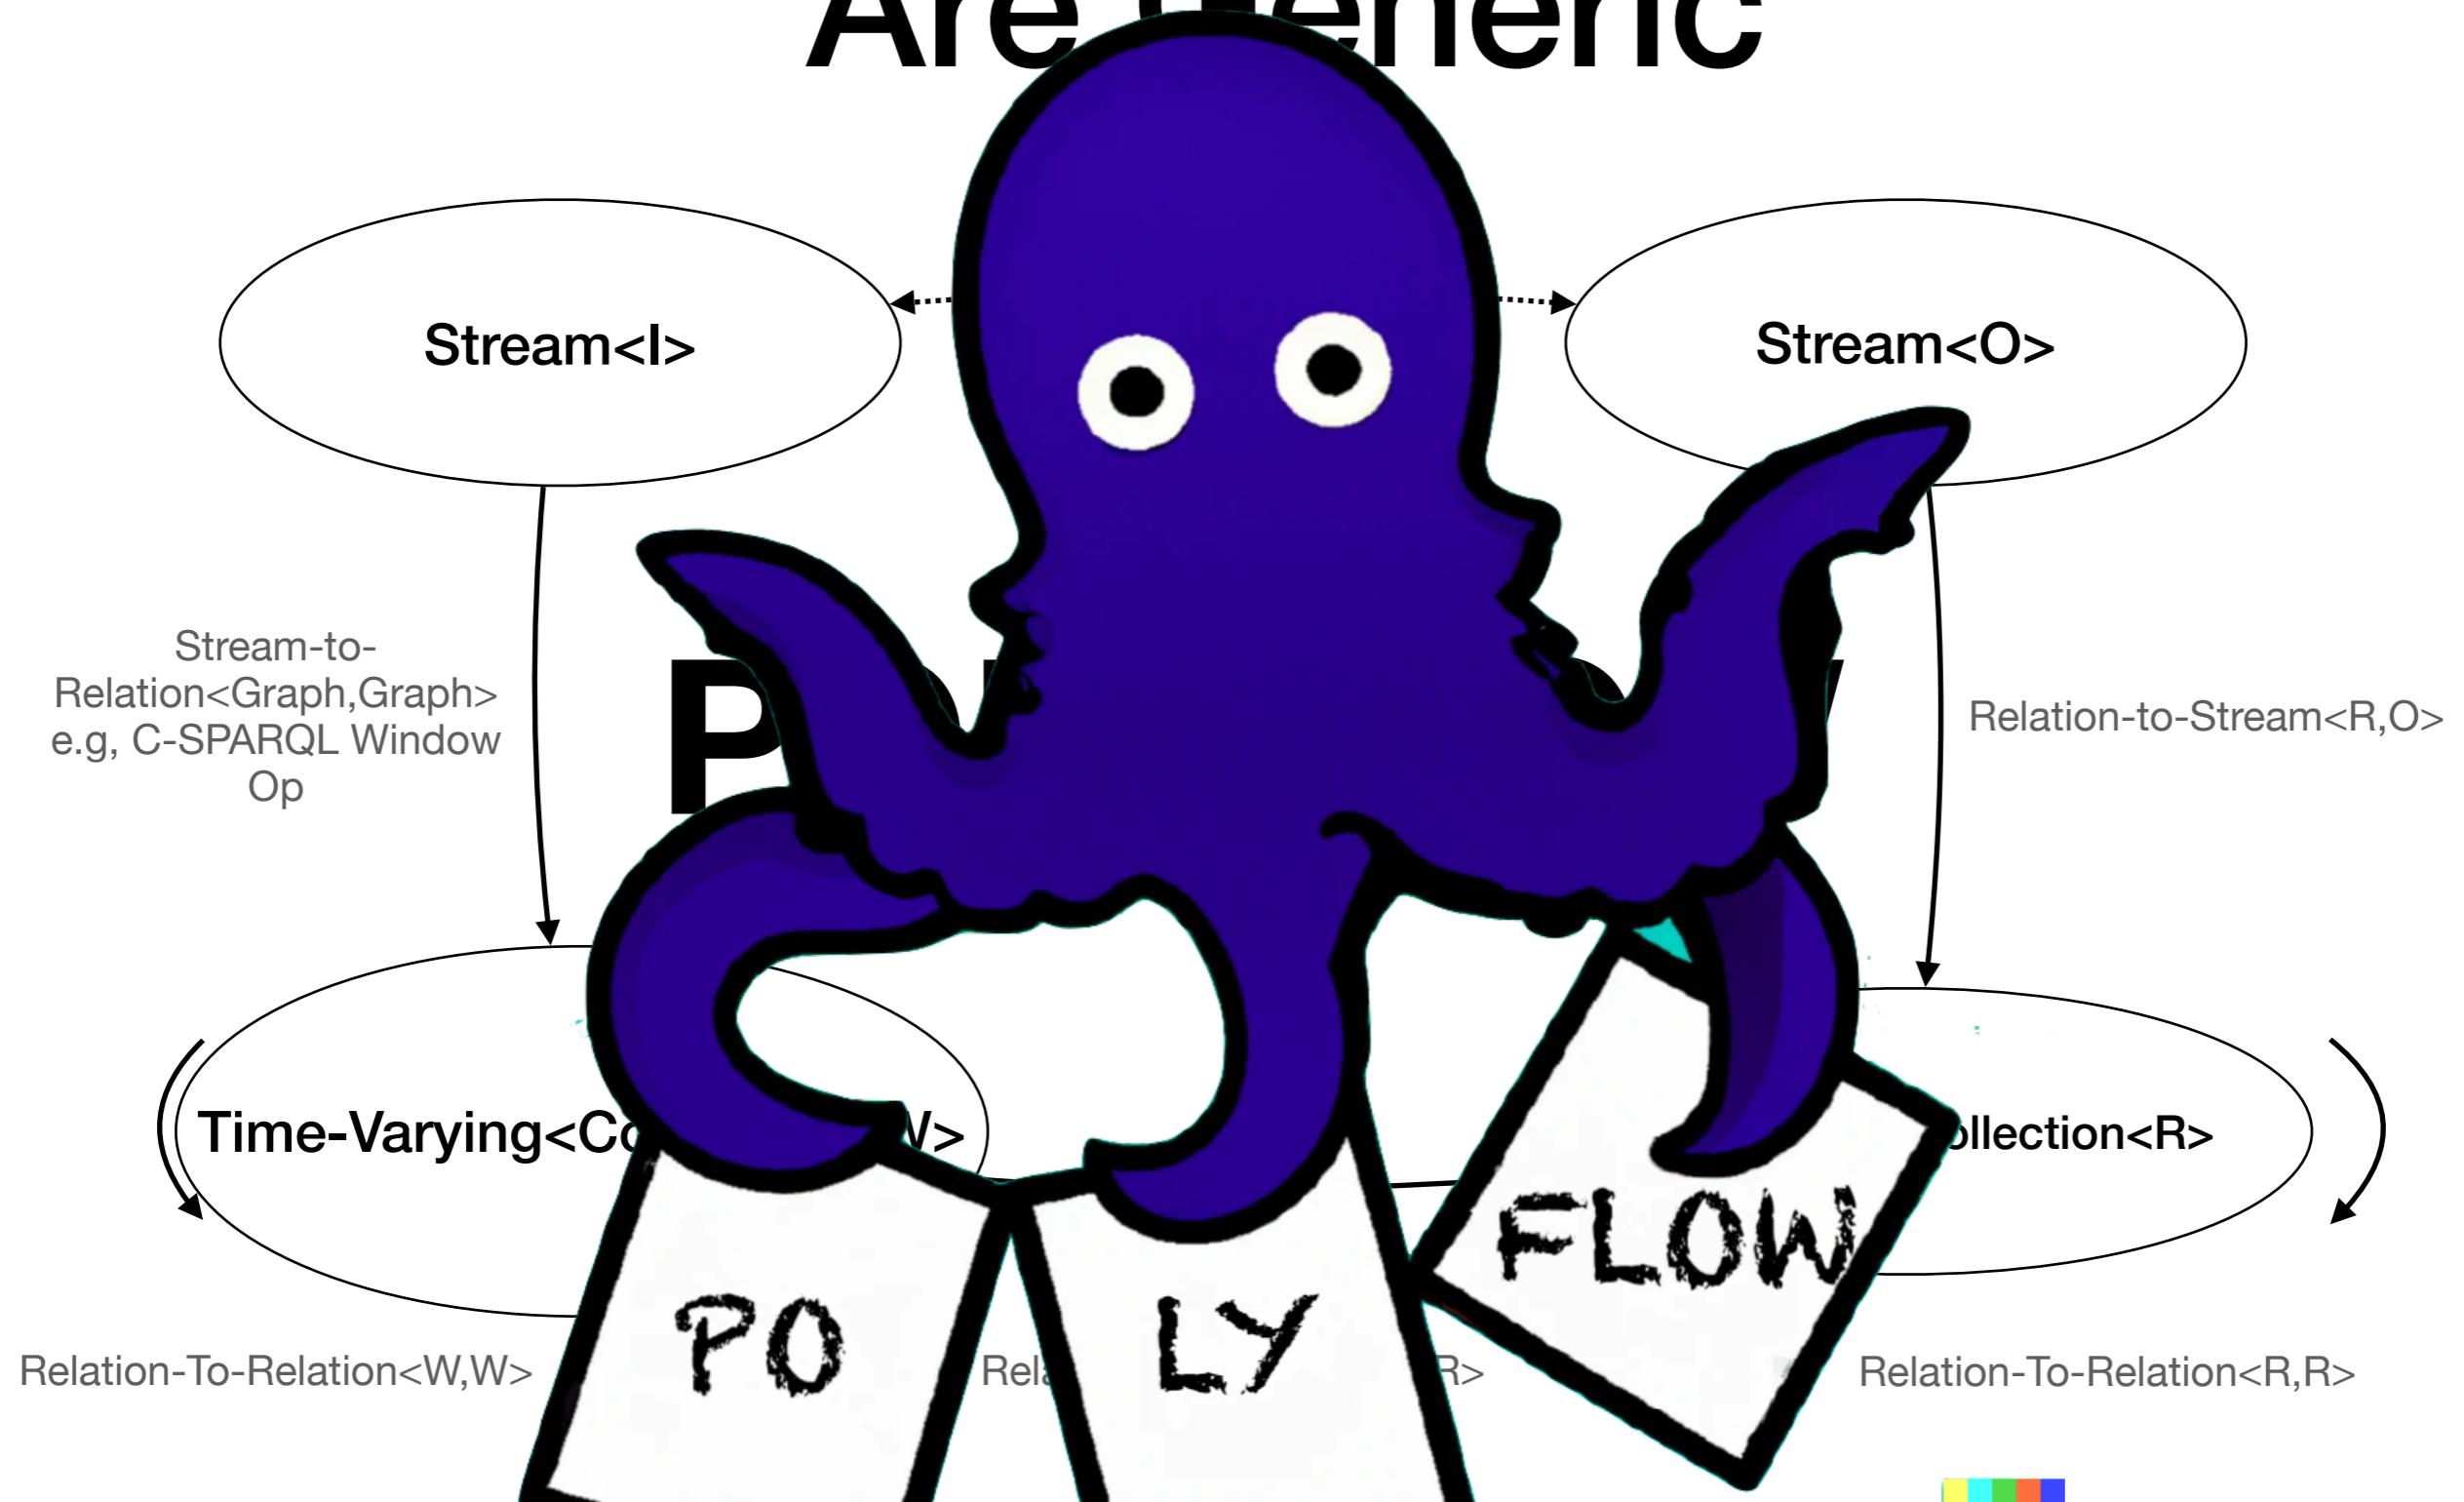

A New Architecture

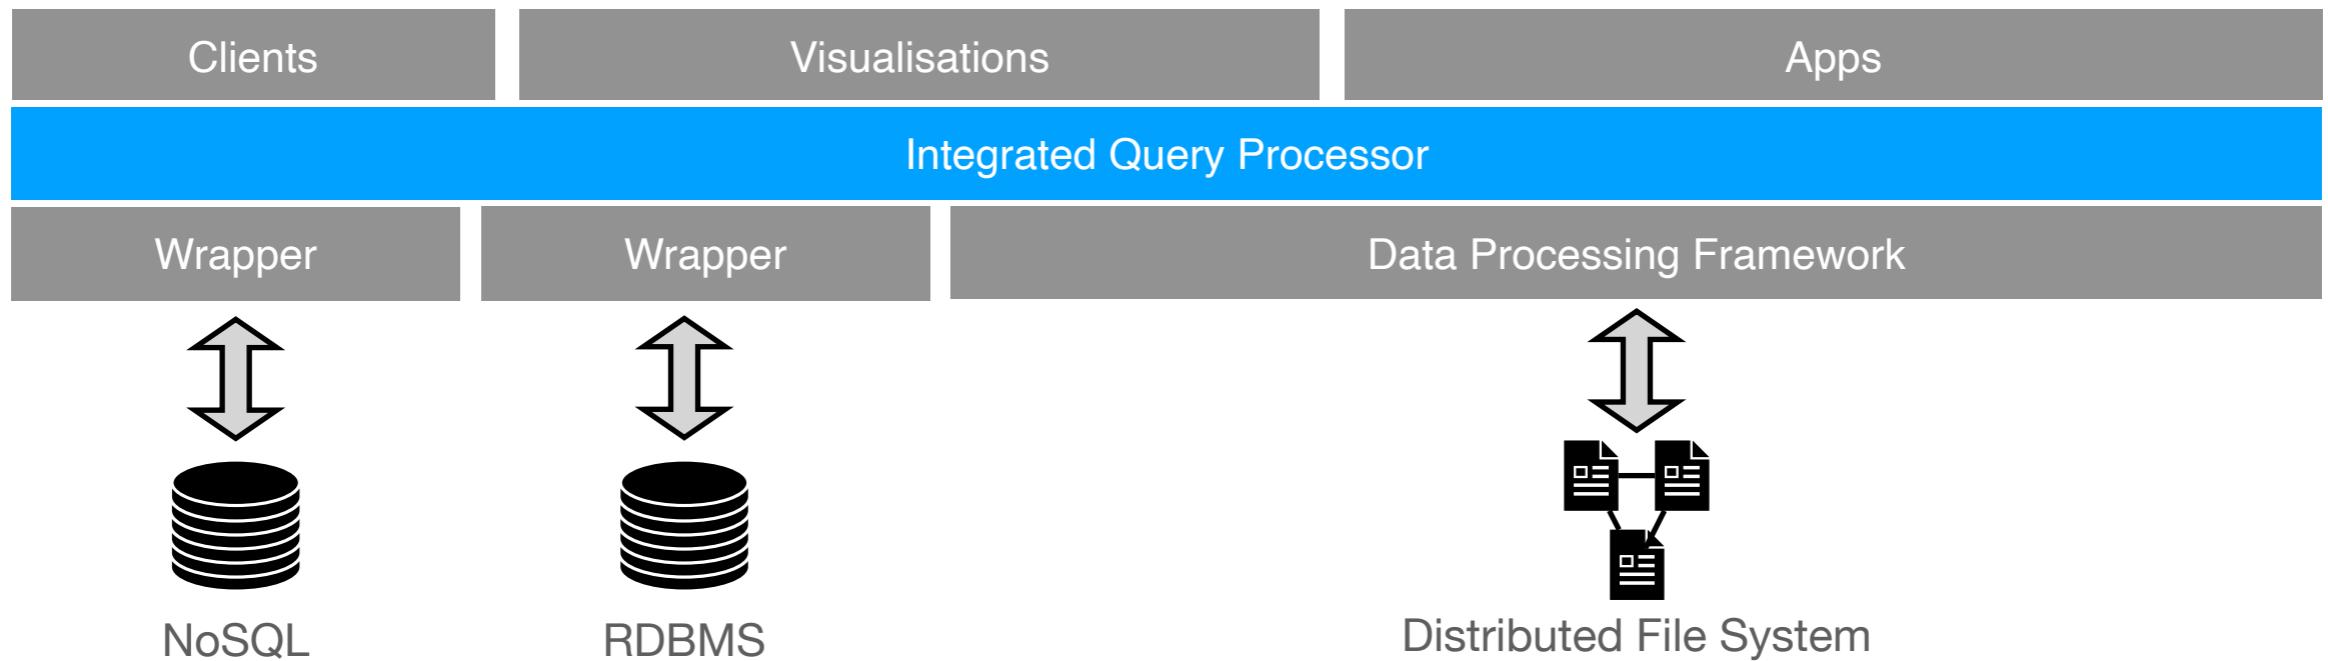

RSP4J Internals

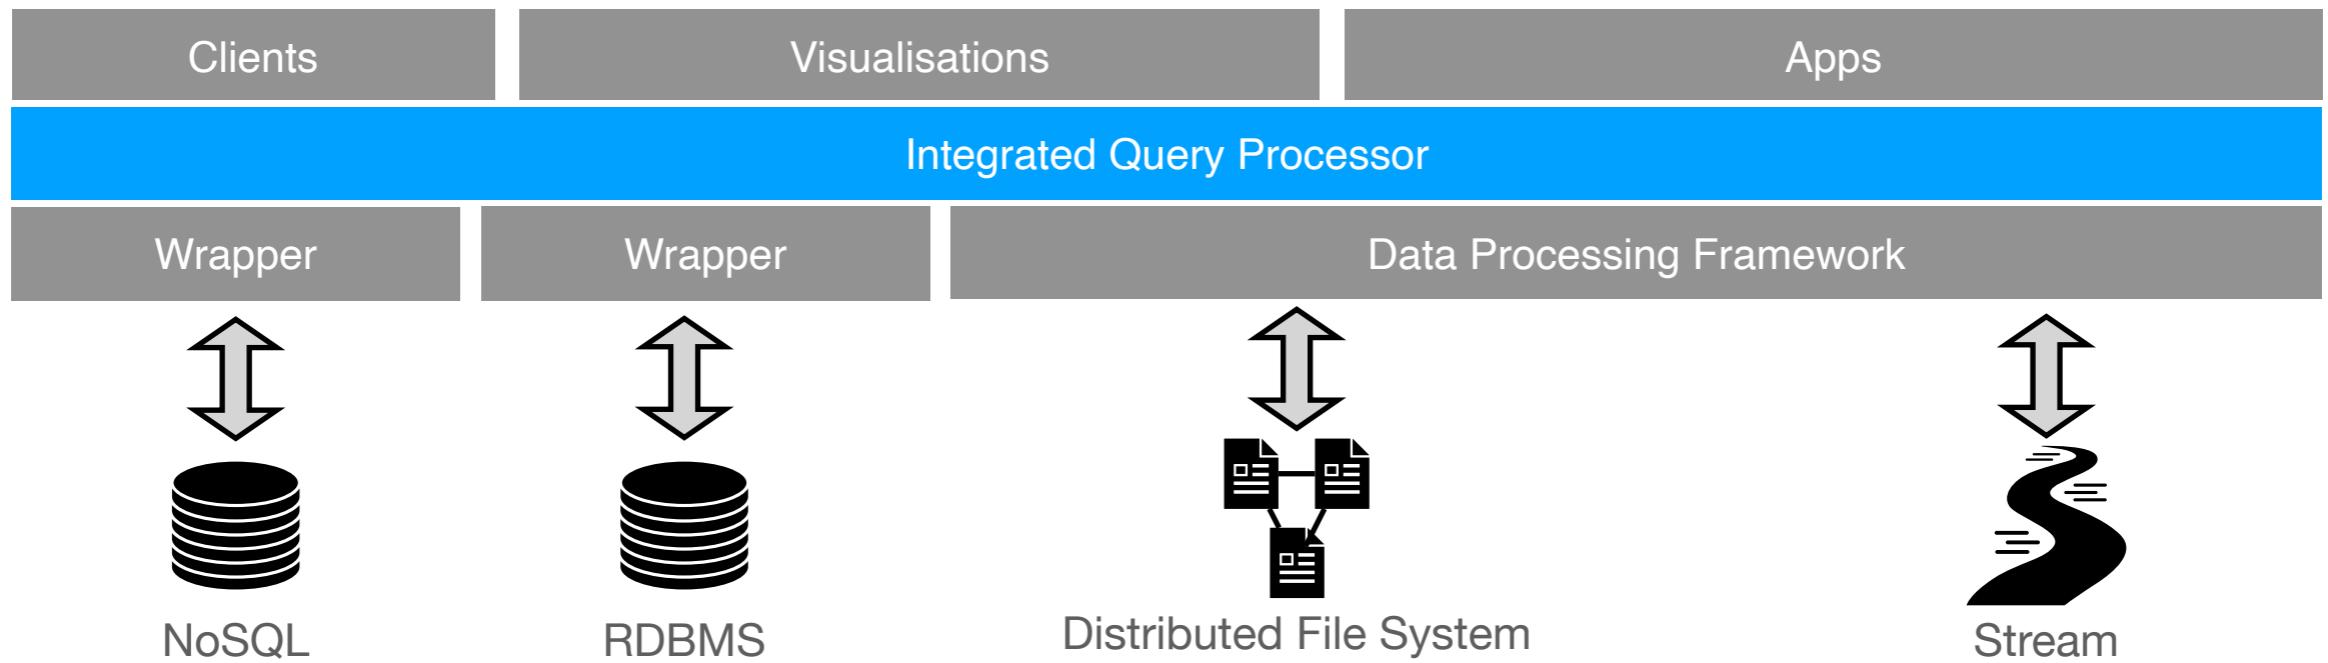

Are Generic

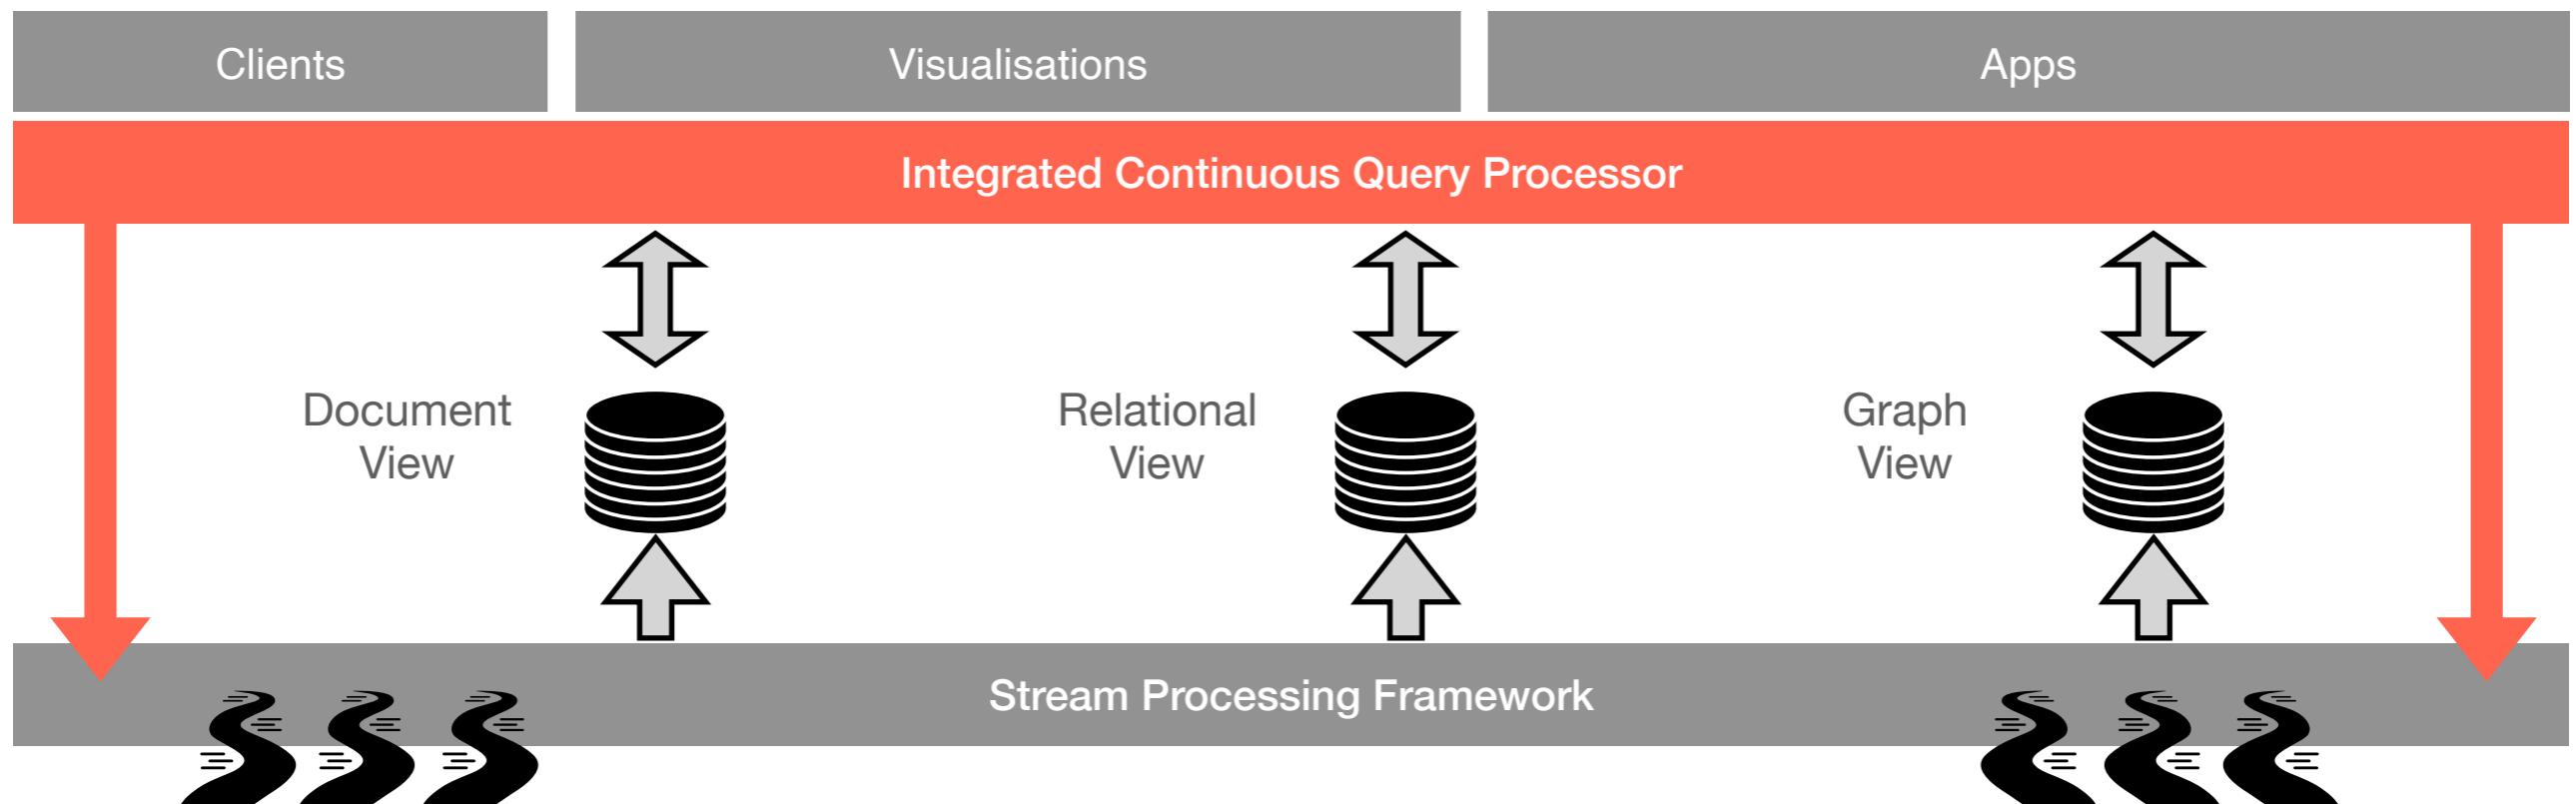

Polystores

Polystores

Polystreaming Systems

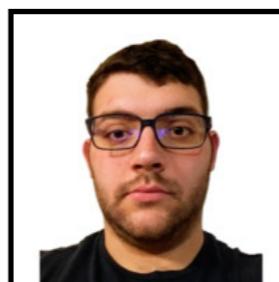

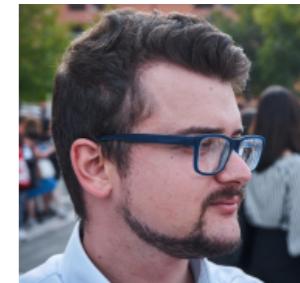

Additional Progress

- More Window Operators:
including Data-Driven Window
- C/Python Bindings for better
data science applications
- Reactive Flow using more
modern APIs.

Summary

- We need a community efforts on cataloging
- Lack of KR methods for Stream Reasoning
- RSP4J++
 - in C++
 - Beyond Graphs: POLYFLOW
